## Functional Description <sup>[1]</sup>

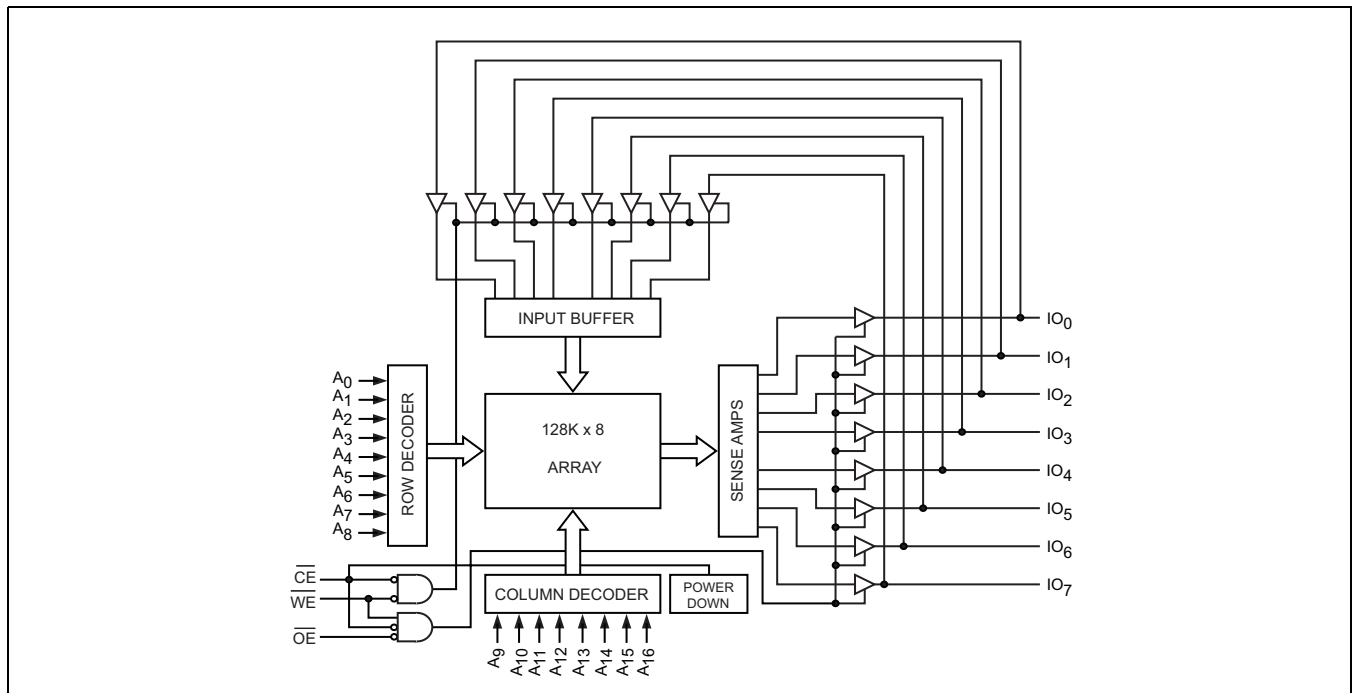

The CY7C1019D is a high-performance CMOS static RAM organized as 131,072 words by 8 bits. Easy memory expansion is provided by an active LOW Chip Enable ( $\overline{CE}$ ), an active LOW Output Enable ( $\overline{OE}$ ), and tri-state drivers. This device has an automatic power-down feature that significantly reduces power consumption when deselected. The eight input and output pins ( $IO_0$  through  $IO_7$ ) are placed in a high-impedance state when:

- Deselected ( $\overline{CE}$  HIGH)
- Outputs are disabled ( $\overline{OE}$  HIGH)
- When the write operation is active ( $\overline{CE}$  LOW, and  $\overline{WE}$  LOW).

Write to the device by taking Chip Enable ( $\overline{CE}$ ) and Write Enable ( $\overline{WE}$ ) inputs LOW. Data on the eight IO pins ( $IO_0$  through  $IO_7$ ) is then written into the location specified on the address pins ( $A_0$  through  $A_{16}$ ).

Read from the device by taking Chip Enable ( $\overline{CE}$ ) and Output Enable ( $\overline{OE}$ ) LOW while forcing Write Enable ( $\overline{WE}$ ) HIGH. Under these conditions, the contents of the memory location specified by the address pins appears on the IO pins.

$t_{HZWE}$	$\overline{WE}$ LOW to High Z <sup>[7, 8]</sup>		5	ns

**Notes**

- Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified  $I_{OL}/I_{OH}$  and 30-pF load capacitance.
- $t_{POWER}$  gives the minimum amount of time that the power supply should be at typical  $V_{CC}$  values until the first memory access can be performed.
- $t_{HZOE}$ ,  $t_{HZCE}$ , and  $t_{HZWE}$  are specified with a load capacitance of 5 pF as in (c) of "AC Test Loads and Waveforms <sup>[4]</sup>" on page 4. Transition is measured when the outputs enter a high impedance state.
- At any given temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZOE}$  is less than  $t_{LZOE}$ , and  $t_{HZWE}$  is less than  $t_{LZWE}$  for any given device.
- This parameter is guaranteed by design and is not tested.
- The internal write time of the memory is defined by the overlap of  $\overline{CE}$  LOW and  $\overline{WE}$  LOW.  $\overline{CE}$  and  $\overline{WE}$  must be LOW to initiate a write, and the transition of any of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.
- The minimum write cycle time for Write Cycle no. 3 ( $\overline{WE}$  controlled,  $\overline{OE}$  LOW) is the sum of  $t_{HZWE}$  and  $t_{SD}$ .

$t_{CDR}^{[3]}$	Chip Deselect to Data Retention Time		0		ns
$t_R^{[12]}$	Operation Recovery Time		$t_{RC}$		ns

**Data Retention Waveform**

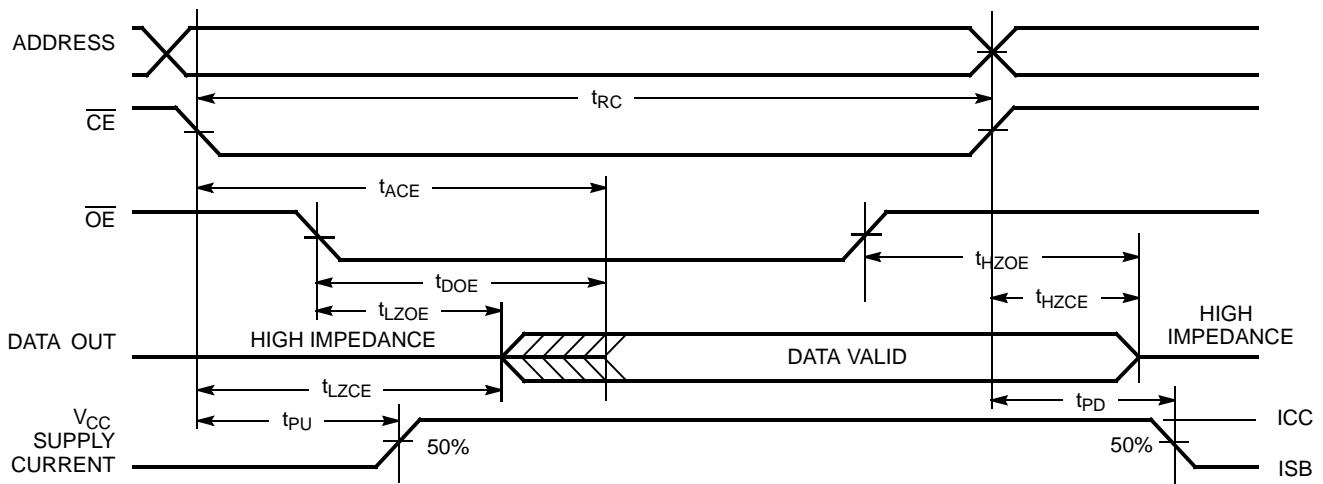

**Switching Waveforms**

**Read Cycle No. 1** (Address Transition Controlled) [13, 14]

**Read Cycle No. 2** ( $\overline{OE}$  Controlled) [14, 15]

**Notes**

- 12. Full device operation requires linear  $V_{CC}$  ramp from  $V_{DR}$  to  $V_{CC(min)} \geq 50 \mu s$  or stable at  $V_{CC(min)} \geq 50 \mu s$ .
- 13. Device is continuously selected.  $\overline{OE}, \overline{CE} = V_{IL}$ .
- 14.  $\overline{WE}$  is HIGH for Read cycle.
- 15. Address valid prior to or coincident with  $\overline{CE}$  transition LOW.

**Switching Waveforms** (continued)

**Write Cycle No. 1** ( $\overline{CE}$  Controlled) [16, 17]

**Write Cycle No. 2** ( $\overline{WE}$  Controlled,  $\overline{OE}$  HIGH During Write) [16, 17]

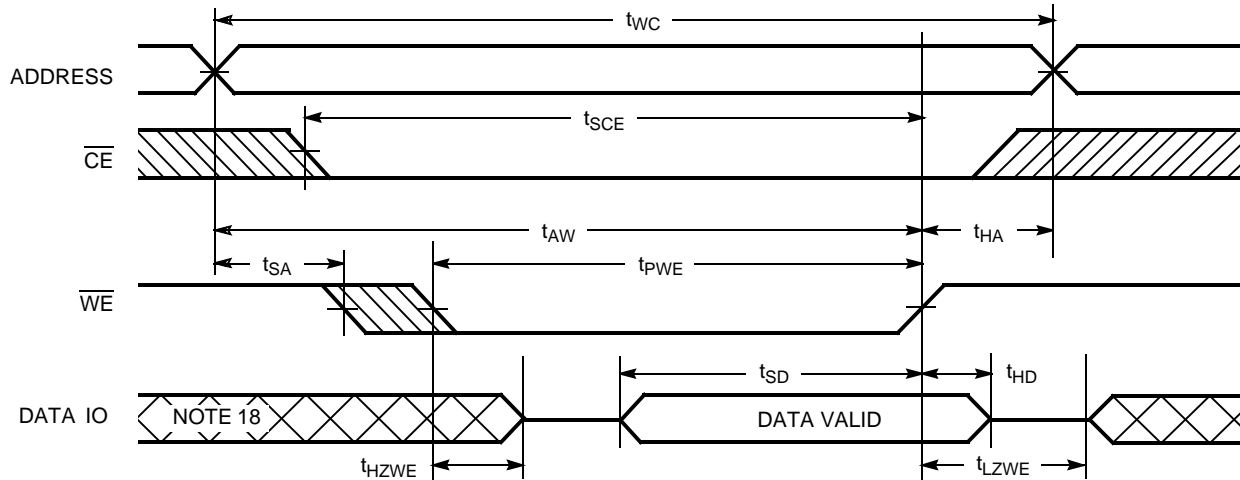

**Notes**

- 16. Data IO is high impedance if  $\overline{OE} = V_{IH}$ .
- 17. If  $\overline{CE}$  goes HIGH simultaneously with  $\overline{WE}$  going HIGH, the output remains in a high-impedance state.
- 18. During this period the IOs are in the output state and input signals should not be applied.

**Switching Waveforms** (continued)

**Write Cycle No. 3** ( $\overline{WE}$  Controlled,  $\overline{OE}$  LOW) [11, 17]
