## 3.3V / 5V ECL Differential Phase-Frequency Detector

### Description

The MC100EP40 is a three-state phase-frequency detector intended for phase-locked loop applications which require a minimum amount of phase and frequency difference at lock. Advanced design significantly reduces the dead zone of the detector. For proper operation, the input edge rate of the R and V inputs should be less than 5 ns. The device is designed to work with a 3.3 V / 5 V power supply.

When Reference (R) and Feedback (FB) inputs are unequal in frequency and/or phase the differential UP (U) and DOWN (D) outputs will provide pulse streams which when subtracted and integrated provide an error voltage for control of a VCO.

When Reference (R) and Feedback (FB) inputs are 80 ps or less in phase difference, the Phase Lock Detect pin will indicate lock by a high state ( $V_{OH}$ ). The  $V_{TX}$  ( $V_{TR}$ ,  $\bar{V}_{TR}$ ,  $V_{TFB}$ ,  $\bar{V}_{TFB}$ ) pins offer an internal termination network for  $50\ \Omega$  line impedance environment shown in Figure 2. An external sinking supply of  $V_{CC}-2\text{ V}$  is required on  $V_{TX}$  pin(s). If you short the two differential  $V_{TR}$  and  $\bar{V}_{TR}$  (or  $V_{TFB}$  and  $\bar{V}_{TFB}$ ) together, you provide a  $100\ \Omega$  termination resistance that is compatible with LVDS signal receiver termination. For more information on termination of logic devices, see AND8020.

The  $V_{BB}$  pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to  $V_{BB}$  as a switching reference voltage.  $V_{BB}$  may also rebias AC coupled inputs. When used, decouple  $V_{BB}$  and  $V_{CC}$  via a  $0.01\ \mu\text{F}$  capacitor and limit current sourcing or sinking to  $0.5\ \text{mA}$ . When not used,  $V_{BB}$  should be left open.

For more information on Phase Lock Loop operation, refer to AND8040.

Special considerations are required for differential inputs under No Signal conditions to prevent instability.

### Features

- Maximum Frequency > 2 GHz Typical
- Fully Differential
- Advanced High Band Output Swing of 400 mV
- Theoretical Gain = 1.11
- $T_{rise}$  97 ps Typical,  $T_{fall}$  70 ps Typical
- The 100 Series Contains Temperature Compensation
- PECL Mode Operating Range:  $V_{CC} = 3.0\text{ V}$  to  $5.5\text{ V}$  with  $V_{EE} = 0\text{ V}$
- NECL Mode Operating Range:  $V_{CC} = 0\text{ V}$  with  $V_{EE} = -3.0\text{ V}$  to  $-5.5\text{ V}$
- $50\ \Omega$  Internal Termination Resistor
- These are Pb-Free Devices\*

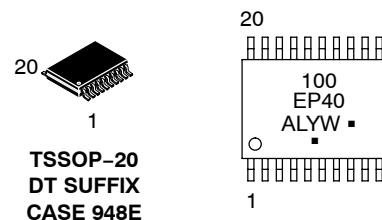

\*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

### MARKING DIAGRAM\*

- A = Assembly Location  
L = Wafer Lot  
Y = Year  
W = Work Week  
▪ = Pb-Free Package

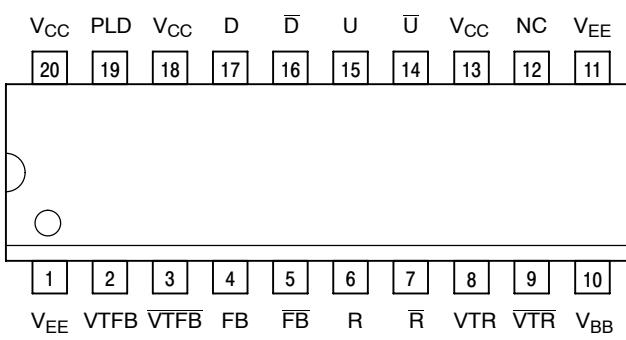

(Note: Microdot may be in either location)

\*For additional marking information, refer to Application Note AND8002/D.

### ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 7 of this data sheet.

# MC100EP40

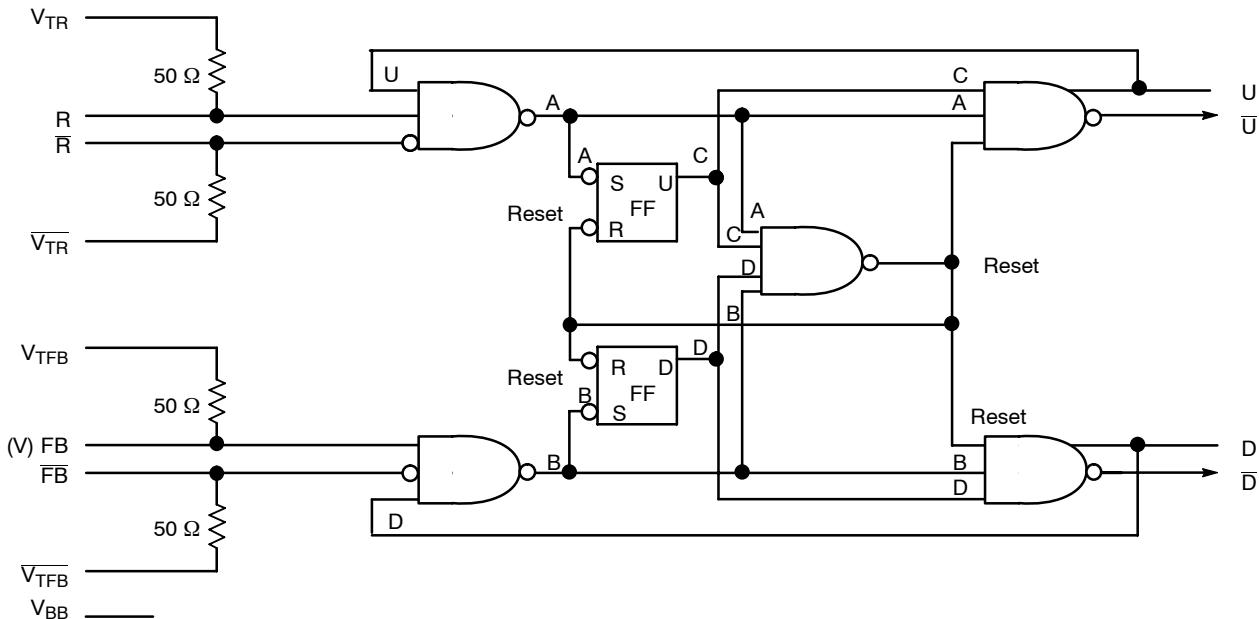

Warning: All V<sub>CC</sub> and V<sub>EE</sub> pins must be externally connected to Power Supply to guarantee proper operation.

T <sub>sol</sub>	Wave Solder Pb Pb-Free			265 265	°C

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

$I_{IH}$	Input HIGH Current			150			150			150	$\mu$ A
$I_{IL}$	Input LOW Current	-150			-150			-150			$\mu$ A

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

2. Input and output parameters vary 1:1 with  $V_{CC}$ .  $V_{EE}$  can vary +0.3 V to -2.2 V.
3. All loading with  $50 \Omega$  to  $V_{CC} - 2.0$  V.
4.  $V_{IHCMR}$  min varies 1:1 with  $V_{EE}$ ,  $V_{IHCMR}$  max varies 1:1 with  $V_{CC}$ . The  $V_{IHCMR}$  range is referenced to the most positive side of the differential input signal.
