## FPF2595

### Description

The FPF2595 advanced load-management switch targets applications requiring a highly integrated solution. It disconnects loads powered from the DC power rail (<6 V) with stringent off-state current targets and high load capacitances (<100  $\mu$ F). The FPF2595 consists of a slew-rate controlled low-impedance MOSFET switch (35 m $\Omega$  typical) and integrated analog features. The slew-rate controlled turn-on characteristic prevents inrush current and the resulting excessive voltage droop on power rails. FPF2595 has over-voltage protection and over-temperature protection.

The FPF2595 has a True Reverse-Current Blocking (TRCB) function that obstructs unwanted reverse current from  $V_{OUT}$  to  $V_{IN}$  during ON and OFF states. The exceptionally low off-state current drain (<2  $\mu$ A maximum) facilitates compliance with standby power requirements. The input voltage range operates from 2.5 V to 5.5 VDC to support a wide range of applications in consumer, optical, medical, storage, portable, and industrial-device power management. Switch control is managed by a logic input (active HIGH) capable of interfacing directly with low-voltage control signal / General-Purpose Input / Output (GPIO) without an external pull-down resistor.

The device is packaged in advanced, fully “green” compliant, 1.3 mm x 1.8 mm, Wafer-Level Chip-Scale Packages (WLCSP).

### Features

- $V_{IN}$ : 2.5 V~5.5 V
- 28 V Absolute Ratings at  $V_{OUT}$
- Current Capability: 3.9 A
  - ◆ Typ 0.1 A~3.5 A with 10% Accuracy
- $R_{ON}$ : Typ. 35 m $\Omega$  & Max. 50 m $\Omega$  at 5  $V_{IN}$  and 1 A  $I_{OUT}$
- Output OVP: Min. = 5.6 V, Typ. = 5.8 V, Max. = 6 V
- No Output Discharge During Off State
- Open-Drain OCP on FLAGB
- Thermal Shutdown
- Under-Voltage Lockout (UVLO)
- True Reverse-Current Blocking (TRCB)
- Logic CMOS IO Meets JESD76 Standard for GPIO Interface and Related Power Supply Requirements

### PIN DESCRIPTION

Pin No.	Name	Description		
A3, B3, C3	V <sub>OUT</sub>	Switch Output		
A1, B1, C1	V <sub>IN</sub>	Supply Input: Input to the power switch		
A2, B2, C2	GND	Ground (True device ground)		
D3	ON	ON/OFF Control Input: Active HIGH – GPIO compatible	Logic HIGH	Switch Enable
			Logic LOW	Switch Disable
D1	OC <sub>FLAGB</sub>	Fault Output: Active LOW, open–drain output that indicates an input over current. External pull–up resistor to V <sub>CC</sub> is required.		
D2	I <sub>SET</sub>	Current Limit Set Input: A resistor from ISET to ground sets the current limit for the switch.

**OPERATION AND APPLICATION DESCRIPTION**

**Input Capacitor**

To limit the voltage drop on the input supply caused by transient inrush current when the switch turns on into discharge load capacitor; a capacitor must be placed in between the V<sub>IN</sub> and GND pins. A high-value capacitor on CIN can be used to reduce the voltage drop in high-current applications.

**Output Capacitor**

An output capacitor should be placed between the V<sub>OUT</sub> and GND pins. This capacitor prevents parasitic board inductance from forcing V<sub>OUT</sub> below GND when the switch is on. This capacitor also prevents reverse inrush current from creating a voltage spike that could damage the device in the case of a V<sub>OUT</sub> short.

**Fault Reporting**

Upon the detection of an over-current, OC\_FLAGB signal the fault by activating LOW.

**Current Limiting**

The current limit ensures that the current through the switch does not exceed the maximum set value, while not limiting the minimum value. The current at which the part's limit is adjustable through the selection of the external resistor connected to the ISET pin. Information for selecting the resistor is found in the section below. The device acts as a constant-current source when the load draws more than the maximum value set by the device until thermal shutdown occurs. The device recovers if the die temperature drops below the threshold temperature.

**Under-Voltage Lockout (UVLO)**

The under-voltage lockout turns the switch off if the input voltage drops below the lockout threshold. With the ON pin active, the input voltage rising above the UVLO threshold releases the lockout and enables the switch.

**True Reverse-Current Blocking**

The true reverse-current blocking feature protects the input source against current flow from output to input regardless of whether the load switch is on or off.

**Thermal Shutdown**

The thermal shutdown protects the die from internally or externally generated excessive temperature. During an over-temperature condition, the switch is turned off. The switch automatically turns on again if the temperature of the die drops below the threshold temperature.

**Setting Current Limit**

The current limit is set with an external resistor connected between the ISET and GND pins. The resistor is selected using Table 1. Resistor tolerance of 1% or less is recommended.

**Table 1. CURRENT LIMIT SETTINGS BY R<sub>SET</sub> (Note )**

11900	90	100	110

9. Table values based on 1% tolerance resistor.

Current limit threshold equation (I<sub>LIM</sub>):

$$R_{SET} (\Omega) = \left( \frac{798439 \text{ mV}}{I_{SET} \text{ mA}} \right)^{1.044}$$

Or: (eq. 1)

$$I_{SET} (\text{mA}) = \frac{798439 \text{ mV}}{R_{SET}^{0.956} \Omega}$$

If current limit is not used it is OK for the ISET pin to be connected with GND, but the maximum current must be less than the maximum current capability of 3.9 A.

**BOARD LAYOUT**

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effect that parasitic trace inductance may have on normal and short-circuit operation. Using wide traces for VIN, VOUT, GND helps minimize parasitic electrical effects along with minimizing the case-to-ambient thermal impedance.
