

## 1. Introduction

### 1.1 Features

- **Fully integrated battery management solution with battery capacity measurement and programmable protection capability.**
- **Supports up to 10 Li-ion or Li-Polymer battery cells in series. RAJ240090 supports 3 to 8 series cells, RAJ240100 supports 3 to 10 series cells.**
- **Integrated with Renesas Ultra Low Power RL78 CPU core for multi-function process**
- **Memory**
  - Code flash memory: 128KB
  - Data flash memory (up to 100,000 erase/write cycles): 4 KB
  - SRAM: 7KB
- **Clock generator**
  - High speed on-chip oscillator: up to 32 MHz
  - Low speed on-chip oscillator: 32 KHz
  - AFE high speed on-chip oscillator: 4.194 MHz
  - AFE low speed on-chip oscillator: 131.072 KHz
- **General Purpose I/O Ports**
  - Total: 31 pins
  - CMOS input/output: 20
  - CMOS input: 4
  - N-ch open drain Input/output [6V tolerance]: 4
  - High voltage input/output [VCC tolerance]: 3
- **Serial interface**
  - CSI (SPI): 2 channels
  - I2C: 1 channel
  - UART: 2 channels
  - Simplified I2C: 2 channels
  - CAN interface (RS-CAN lite): 1 channel
- **Timer**
  - MCU 16-bit timer: 6 channels
  - MCU 12-bit interval timer: 1 channel
  - MCU Real time clock: 1 channel
  - AFE timer: 2 channels
    - AFE timer A: setting range: 125 ms to 64 s
    - AFE timer B: setting range : 30.52 us to 125 ms
- **Embedded A/D converter**
  - AFE 15-bit resolution sigma-delta A/D converter
  - MCU 8/10-bit resolution A/D converter
- <R> ■ **Battery cell voltage and temperature (AN port voltage) detection circuit**
  - Monitoring over/under voltage and temperature by Sigma-delta AD converter (AFE) without controlling from MCU
- **Current integration circuit**
  - 18-bit resolution sigma-delta A/D converter
- **Impedance measurement circuit**
  - Simultaneous measurement of battery voltage and current
- **Over current detection circuit**
  - Short circuit current detection
  - Charge overcurrent detection
  - Discharge overcurrent detection
  - Charge wakeup current detection
  - Discharge wakeup current detection
- **Series regulator**
  - 3.3V or 5.0V CREG2
  - Over 100mA output current by external Nch MOSFET
- **Charge and Discharge MOSFET control**
  - High side Nch MOSFET drive circuit embedded
  - Programmable MOSFET control by 8-bit PWM
- **Support RTC function**
  - To connect External crystal resonator (32.768 kHz) and generate internal clock.
- <R> ■ **Voltage and temperature condition**
  - Power supply voltage: VCC = 4.0 to 50 V
  - Operating ambient temperature
    - RAJ240090 supports  $T_A = -20$  to  $+85^\circ\text{C}$
    - RAJ240100 supports  $T_A = -40$  to  $+85^\circ\text{C}$
- **Package Information**
  - 64 pin plastic mold LQFP
  - ([Body] 10.0 mm x 10.0 mm, 0.5 mm pitch)

### 1.2 Applications

- E-Bike, E-Scooter, Pedal-Assist Bicycle
- Power Tool, Vacuum Cleaner, Drone
- Battery Backup System, Energy Storage System (ESS)

### 1.3 Description

RAJ240090 / RAJ240100 are Renesas Li-ion battery fuel gauge IC (FGIC) which consist of a MCU device and an AFE device in a single package. Pack with a variety of battery management features and Renesas RL78 CPU core which has multiple low power modes and capable of achieving high performance in ultra-low power operation. RAJ240090 / RAJ240100 fuel gauge IC have control firmware stored in embedded flash memory to control attached embedded analog and digital circuits to execute battery voltage / current / temperature measurement, remaining capacity estimation, over current / voltage / temperature protection and other battery management operations.

Item		Description
Code flash memory		128 KB
Data Flash memory		4 KB
RAM		7 KB
Address size		1MB
Main system clock	High speed on-chip Oscillator clock(fIH)	HS (high-speed main) mode: 1 to 32 MHz LS (low-speed main) mode: 1 to 8 MHz ,
Subsystem clock		XT1 (crystal) oscillation, external subsystem clock input (EXCLKS) 32.768 kHz
Low speed on-chip oscillator clock		15 kHz (TYP.)
General purpose register		8 bits × 32 registers (8 bits × 8 registers × 4 banks)
Minimum instruction execution time		0.03125 us (Internal high speed oscillation clock: fIH = 32 MHz) 30.5 us (Subsystem clock : fSUB = 32.768 kHz operation)
Instruction set		<ul style="list-style-type: none"> <li>• Data transmission (8/16 bits)</li> <li>• Addition and subtraction/logical operations (8/16 bits)</li> <li>• Multiplication (8×8 bits, 16×16 bits), Division (16÷16 bits, 32÷32 bits)</li> <li>• Multiplication and Accumulation (16 bits × 16 bits + 32 bits)</li> <li>• Rotate, barrel shift, bit manipulation (set, reset, test, Boolean operation) etc.</li> </ul>
I/O Port	CMOS I/O	20
	CMOS input	4
	N-ch open-drain I/O [6V tolerance)	4
	High voltage I/O	3
Timer	16-bit timer	6 channels (TAU : 4 channels, Timer RD : 2 channels)
	Watchdog timer	1 channel
	Real time clock	1 channel
	12-bit interval timer	1 channel
	Timer output	Timer outputs: 6 channels PWM outputs: 3 channels
	RTC output	1 channel
8/10-bit resolution A/D converter		4 channels
Serial interface		<ul style="list-style-type: none"> <li>• CSI: 1 channel/UART: 1 channel/simplified I2C: 1 channel</li> <li>• CSI: 1 channel/UART: 1 channel/simplified I2C: 1 channel</li> </ul>

Item	Description
PWM	8 bits or 10 bits x1 for FET control
Sigma-delta A/D converter	15-bit resolution (sigma-delta method) <ul style="list-style-type: none"> <li>• Battery Cell voltage (Cell 1 to 8 in RAJ240090, Cell 1 to 10 in RAJ240100)</li> <li>• Battery Cell total voltage (VIN8 pin in RAJ240090, VIN10 pin in RAJ240100)</li> <li>• Charge voltage (PACK pin)</li> <li>• PON pin input voltage</li> <li>• Thermistor sensor port with on-chip pull-up 10kohm resistor: 3 channels</li> <li>• On-chip simple temperature sensor (temperature range: -20 to 85C)</li> <li>• Internal reference and supply voltage (MCU and AFE)</li> </ul>
Battery cell voltage and temperature (AN port voltage) detection circuit <sup>Note1</sup>	Battery Cell voltage detection <ul style="list-style-type: none"> <li>• Over voltage (Overcharge voltage)</li> <li>• Under voltage (Overdischarge voltage)</li> </ul> Temperature (AN port voltage) detection <ul style="list-style-type: none"> <li>• Over temperature</li> <li>• Under temperature</li> </ul>
Current integrating circuit	1 channel:18-bit resolution
Current integrating circuit for impedance measurement	1 channel:15-bit resolution
Overcurrent detection circuit and wake up current detection circuit	<ul style="list-style-type: none"> <li>• Discharge short-circuit current detection</li> <li>• Discharge overcurrent detection</li> <li>• Charge overcurrent detection,</li> <li>• Wake up current detection (discharge and charge)</li> </ul>
<R> Simple temperature sensor	1 channel
<R> Charge/Discharge FET control circuit	NchFET driver for charge control NchFET driver for discharge control
Power on reset circuit	Return from power down mode by detecting voltage and connecting charger
Series regulator	VREG2 : power supply for MCU (3.3 V or 5.0V)
Reset circuit	Series regulator output monitoring (VREG2)
Cell balancing circuit	8 series cells support in RAJ240090 10 series cells support in RAJ240100 (On-resistor: 200ohm TYP)
MCU runaway detection circuit	20 bitsx1(2 / 4 / 8 / 16 / 32 / 64 [s] to be selected)
AFE On-chip oscillator	4.194 MHz (TYP)
AFE low speed On-chip oscillator	131.972KHz(TYP)
AFE timer	2 channels <ul style="list-style-type: none"> <li>• AFE timer A (setting range : 125 ms to 64 s)</li> <li>• AFE timer B (setting range : 30.52 us to 125 ms)</li> </ul>
MCU-AFE communication interface(C2C)	AFE ~ MCU communication (Chip to Chip Interface)
Power supply voltage	VCC = 4.0 to 50 V
<R> Operation ambient temperature <sup>Note2</sup>	-20 to 85C (REG2T6 bit (bit6 of REG2T)= 0) -40 to 85C (REG2T6 bit (bit6 of REG2T)= 1)
Package	64 pin plastic mold LQFP([Body] 10.0mm x 10.0mm , 0.5 mm pitch, 1.4 mm thickness)

<R> Note 1. Battery cell voltage and temperature (AN port voltage) detection circuit is only available in RAJ240100.

Note 2. Operation ambient temperature  $T_A = -40$  to 85C is only applicable to RAJ240100.

## 2.2 RAJ240090 Pin Configuration

· 64 pin plastic mold LQFP ([Body] 10.0mm x 10.0mm , 0.5 mm pitch)

**Caution 1.** REGC pin connects to VSS pin through a capacitor (0.47 to 1μ F)

**Caution 2.** CREG2 pin connects to GND0/GND1 pin through a capacitor (1 to 4.7uF).

**Remark 1.** Pin name refer to [Section 3.1 pin identification].

**Remark 2.** Functions in parentheses in the above figure can be assigned via settings in the peripheral I/O redirection register 0 (PIOR0).

### 2.3 RAJ240100 Pin Configuration

• 64 pin plastic mold LQFP([Body] 10.0mm x 10.0mm , 0.5 mm pitch)

**Caution 1.** REGC pin connects to VSS pin through a capacitor (0.47 to 1μ F)

**Caution 2.** CREG2 pin connects to GND0/GND1 pin through a capacitor (1 to 4.7uF).

**Remark 1.** Pin name refer to [Section 3.1 pin identification].

**Remark 2.** Functions in parentheses in the above figure can be assigned via settings in the peripheral I/O redirection register 0 (PIOR0).

P122	2-2-2			input	
P123	2-2-1	XT1			
P124	2-2-1	XT2/EXCLKS			
P137	2-1-2	input	Input port	INTP3	Port 13. 1-bit input-only port.
RESET	2-1-1	input	-	-	Input-only pin for external reset. Connect to VDD directly or via a resistor when external reset is not used.

**Note 1.** Each pin can be configured as digital or analog pin by setting the port mode in the control register x (PMCx) (Can be specified in 1-bit units).

**Note 2.** Connected to internal AFE circuit.

## 3.2.2 External Pin Functions

(1/2)

Category	Pin name	I/O	Function
Power supply	VCC	–	Power supply input Apply power supply voltage to VCC pin from a charger or battery.
	GND0, GND1	–	Device ground input. Connect the negative input terminal of lithium-ion battery 1 to the GND0 and GND1 pins
	CREG2F	–	Series regulator force port
	CREG2S	–	Series regulator sense port Connect to GND0 and GND1 via a capacitor (1uF to 4.7uF)
	VDD	–	Positive power supply for MCU Connect to CREG2
	VSS	–	Ground input for MCU Connect the negative input terminal of lithium-ion battery 1 to the GND0 and GND1 pins
	REGC <sup>Note 1.</sup>	–	Pin for connecting regulator output stabilization capacitance for internal operation. Connect this pin to VSS via a capacitor (0.47 to 1 uF). Also, use a capacitor with good characteristics, since it is used to stabilize internal voltage.
RESET	RESET	Input	This is the active-low system reset input pin for MCU.
	RESETOUT	output	This is the active-low system reset output pin for AFE.
TOOL0	TOOL0 <sup>Note 2</sup>	input	Data I/O for flash memory programmer/debugger. Connect to the VDD via an external pull-up resistor in the on chip debug mode
Serial interface (UART0, UART1)	RxD0, RxD1	input	Serial data input pins of serial interface UART0 to UART1
	TxD0, TxD1	output	Serial data output pins of serial interface UART0 to UART1
Serial interface (CSI00, CSI10)	SCK00, SCK10	I/O	Serial clock I/O pins of serial interface CSI00 and CSI10
	SI00, SI10	input	Serial data input pins of serial interface CSI00 and CSI10
	SO00, SO10	output	Serial data output pins of serial interface CSI00 and CSI10
Serial interface (IIC00, IIC10)	SCL00, SCL10	output	Serial clock output pins of serial interface IIC00 and IIC10
	SDA00, SDA10	I/O	Serial data I/O pins of serial interface IIC00 and IIC10
Serial interface (IICA0)	SCLA0	I/O	Serial clock I/O pins of serial interface IICA0
	SDAA0	I/O	Serial data I/O pins of serial interface IICA0,
CAN-BUS interface	CRXD0	input	CAN serial data input
	CTXD0	output	CAN serial data output
A/D converter	AN0, AN1, AN2	input	AFE A/D converter analog input
	ANI0, ANI1, ANI2, ANI3	input	MCU A/D converter analog input
	AVREFP	input	A/D converter reference voltage (+ side).
	AVREFM	input	A/D converter reference voltage (- side).
Current integration circuit and overcurrent detection circuit	ISENS0, ISENS1	input	Analog input for current integration circuit and over current detection circuit
Timer	TI00-TI02	input	The pins for inputting an external count clock/capture trigger to 16-bit timers 00 to 02
	TO00-TO02	output	Timer output pins of 16-bit timers 00 to 02
	TRDIOB0 TRDI0C0 TRDI0D0	I/O	Timer RD input/output
	RTC1HZ	output	Real-time clock supports clock (1 Hz) output

(2/2)

Category	Pin name	I/O	Function
High voltage I/O port	HVP0, HVP1, HVP2	I/O	High voltage I/O in correspondence with VCC tolerance
Subsystem clock	XT1, XT2 <sup>Note 3</sup>	—	Resonator connection for subsystem clock
External clock	EXCLK	Input	External clock input for main system clock
	EXCLKS	input	External clock input for subsystem clock
External interrupt input	INTP0 to INTP13	input	Interrupt request input pin. INTP8 to INTP13 connects interrupt request signal of AFE in the package and do not connect to any pin
Power on circuit	PON	input	Power on input for release from power down state
Charger connection detect	PACK	Input	Charger voltage input and source voltage of discharge FET drive port (DFOUT)
Battery connection detect	VBAT	input	Sense voltage input pin for most positive cell and source voltage for charge FET drive port (CFOUT)
Battery voltage detection circuit	VIN10 <sup>Note 4</sup>	input	The positive input terminal of lithium-ion battery 10.
	VIN9 <sup>Note 4</sup>	Input	The negative input terminal of lithium-ion battery 10 and the positive input terminal of lithium-ion battery 9
	VIN8	Input	The negative input terminal of lithium-ion battery 9 and the positive input terminal of lithium-ion battery 8
	VIN7	Input	The negative input terminal of lithium-ion battery 8 and the positive input terminal of lithium-ion battery 7
	VIN6	Input	The negative input terminal of lithium-ion battery 7 and the positive input terminal of lithium-ion battery 6
	VIN5	Input	The negative input terminal of lithium-ion battery 6 and the positive input terminal of lithium-ion battery 5

**<R> 4. ELECTRICAL SPECIFICATIONS**

**Caution** This product has an on-chip debug function, which is provided for development and evaluation. Do not use the on-chip debug function in products designated for mass production because the guaranteed number of rewritable times of the flash memory may be exceeded when this function is used, and product reliability therefore cannot be guaranteed. Renesas Electronics is not liable for problems occurring when the on-chip debug function is used.

**Remark 1.** Specifications for VIN10 pin and VIN9 pin are only applicable to RAJ240100.

**Remark 2.** Operation ambient temperature  $T_A = -40$  to  $85^\circ\text{C}$  is only applicable to RAJ240100.

(Note, Caution and Remark are listed on next page.)

- Note 1.** Connect the REGC pin to VSS via a capacitor (0.47 to 1uF). This value regulates the absolute maximum rating of the REGC pin. Do not use this pin with voltage applied to it.
- Note 2.** Connect the CREG2 pin to GND0 or GND1 via a capacitor (2.2uF). This value regulates the absolute maximum rating of the CREG2 pin.
- Note 3.** Must be 6.5V or lower.
- Note 4.** Do not exceed AVREF (+) + 0.3V in case of A/D conversion target pin.
- Note 5.** Must be 60V or lower.
- Caution** **Product quality may degrade if the absolute maximum rating has been exceeded. The absolute maximum ratings are rated values where the product is on the verge of suffering physical damage, therefore the product must be used within conditions that ensure the absolute maximum ratings are not exceeded.**

**Remark 1.** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

**Remark 2.** AVREF (+): + side reference voltage of the A/D converter.

**Remark 3.** GND (GND0, GND1 and VSS): Reference voltage.

**Caution 1.** After trimming.

**Caution 2.** When RAJ240100 is used in  $T_A = -40$  to  $85C$ , REG2T6 (bit 6 of REG2T register) must be set to "1".

**Remark** Values in brackets are design value.

### 4.5 Pin characteristics

(1/5)

( $T_A = -40/-20$  to  $+85C$ ,  $4.0V \leq VCC \leq 50V$ ,  $2.7V \leq VDD \leq 5.5V$ ,  $GND0 = GND1 = VSS = 0V$ )

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit	
Output current, high <sup>Note 1</sup>	IOH1	Per pin for P00 to P07, P10 to P16, P40			-10.0 <small>Note 2</small>	mA	
		Total of P00 to P07, P10 to P16, P40 (When duty $\leq 70\%$ <sup>Note 3</sup> )	$4.0V \leq VDD \leq 5.5V$		-55.0	mA	
			$2.7V \leq VDD < 4.0V$		-10.0	mA	
	IOH2	Total of all pins (When duty $\leq 70\%$ <sup>Note 3</sup> )	$2.7V \leq VDD \leq 5.5V$			-100.0	mA
		Per pin for P20 to P23	$2.7V \leq VDD \leq 5.5V$			-0.1 <small>Note 2</small>	mA
			Total of all pins (When duty $\leq 70\%$ <sup>Note 3</sup> )	$2.7V \leq VDD \leq 5.5V$			-1.5

**Note 1.** Value of current at which the device operation is guaranteed even if the current flows from the VDD pins to an output pin.

**Note 2.** Do not exceed the total current value.

**Note 3.** Specification under conditions where duty factor  $\leq 70\%$ .

The output current value that has changed to the duty factor  $> 70\%$  the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

• Total output current from pins =  $(I_{OH} \times 0.7)/(n \times 0.01)$

<Example> Where  $n = 80\%$  and  $I_{OH} = -10.0$  mA

Total output current from pins =  $(-10.0 \times 0.7)/(80 \times 0.01) \approx -8.7$  mA

However, the allowable current flow into one pin does not change with the duty factor.

A current higher than the absolute maximum rating must not flow into any one pin.

**Caution 1.** P03, P04, and P10 to P16 do not output high level in N-ch open-drain mode.

**Caution 2.** When RAJ240100 is used in  $T_A = -40$  to  $85C$ , REG2T6 (bit 6 of REG2T register) must be set to "1".

**Remark** Unless specified otherwise, the characteristics of alternate-function pins are the same as those of the port pins.

( $T_A = -40/-20$  to  $+85C$ ,  $4.0V \leq V_{CC} \leq 50V$ ,  $2.7V \leq V_{DD} \leq 5.5V$ ,  $GND0 = GND1 = VSS = 0V$ )

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit	
Output current, low <sup>Note 1</sup>	IOL1	Per pin for P00 to P07, P10 to P16, P40			20.0 <small>Note 2</small>	mA

		Total of P00 to P07, P10 to P16, P40 (When duty $\leq 70\%$ <sup>Note 3</sup> )	$4.0V \leq V_{DD} \leq 5.5V$			70.0	mA
			$2.7V \leq V_{DD} < 4.0V$			15.0	mA
	Total of all pins (When duty $\leq 70\%$ <sup>Note 3</sup> )				150.0	mA	
	IOL2	Per pin for P20 to P23				0.4 <small>Note 2</small>	mA
		Total of all pins (When duty $\leq 70\%$ <sup>Note 3</sup> )	$2.7V \leq V_{DD} \leq 5.5V$			5.0	mA

**Note 1.** Value of current at which the device operation is guaranteed even if the current flows from an output pin to the VSS pins.

**Note 2.** Do not exceed the total current value.

**Note 3.** Specification under conditions where the duty factor  $\leq 70\%$ .

The output current value that has changed to the duty factor  $> 70\%$  the duty ratio can be calculated with the following expression (when changing the duty factor from 70% to n%).

• Total output current of pins =  $(IOL \times 0.7)/(n \times 0.01)$

<Example> Where  $n = 80\%$  and  $IOL = 10.0$  mA

Total output current of pins =  $(10.0 \times 0.7)/(80 \times 0.01) \approx 8.7$  mA

However, the allowable current flow into one pin does not change with the duty factor.

A current higher than the absolute maximum rating must not flow into any one pin.

**Caution** When RAJ240100 is used in  $T_A = -40$  to  $85C$ , REG2T6 (bit 6 of REG2T register) must be set to "1".

### 4.8.11 VREG2 Voltage Drop Detection Circuit characteristics

( $T_A = -40/-20$  to  $+85C$ ,  $4.0V \leq VCC \leq 50V$ ,  $GND0 = GND1 = VSS = 0V$ )

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
VREG2 Voltage detection threshold	VR2LVD	3.3V setting	2.85	2.90	2.95	V
	VR2LVD5	5.0V setting	4.55	4.60	4.65	V

**Caution** When RAJ240100 is used in  $T_A = -40$  to  $85C$ , REG2T6 (bit 6 of REG2T register) must be set to "1".

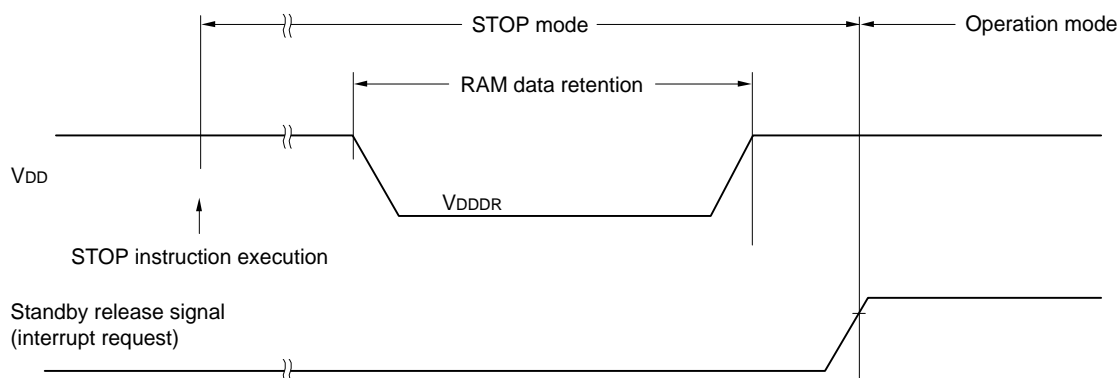

### 4.9 RAM Data Retention Characteristics

( $T_A = -40/-20$  to  $+85$ C,  $2.7V \leq VDD \leq 5.5V$ ,  $GND0 = GND1 = VSS = 0V$ )

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Data retention supply voltage	VDDDR		1.46 <sup>Note</sup>		5.5	V

**Note** The value depends on the POR detection voltage. When the voltage drops, the RAM data is retained before a POR reset is effected, but RAM data is not retained when a POR reset is effected.

**Caution** When RAJ240100 is used in  $T_A = -40$  to  $85$ C, REG2T6 (bit 6 of REG2T register) must be set to "1".

### 4.10 Flash Memory Programming Characteristics

## 5. Detailed description

### 5.1 Overview

RAJ240090 / RAJ240100 are Renesas fuel gauge ICs which consist of a MCU block and an AFE block in a single package and accomplish various protection mechanisms. These IC's incorporates advanced battery management features such as primary and secondary protection, voltage and current measurement, current integration, host communication interface. By using the battery management controlled firmware and data are stored in the embedded flash memory to control the embedded analog and digital hardware circuits, optimum battery management operation including high accuracy remaining capacity estimation and battery safety can be achieved.

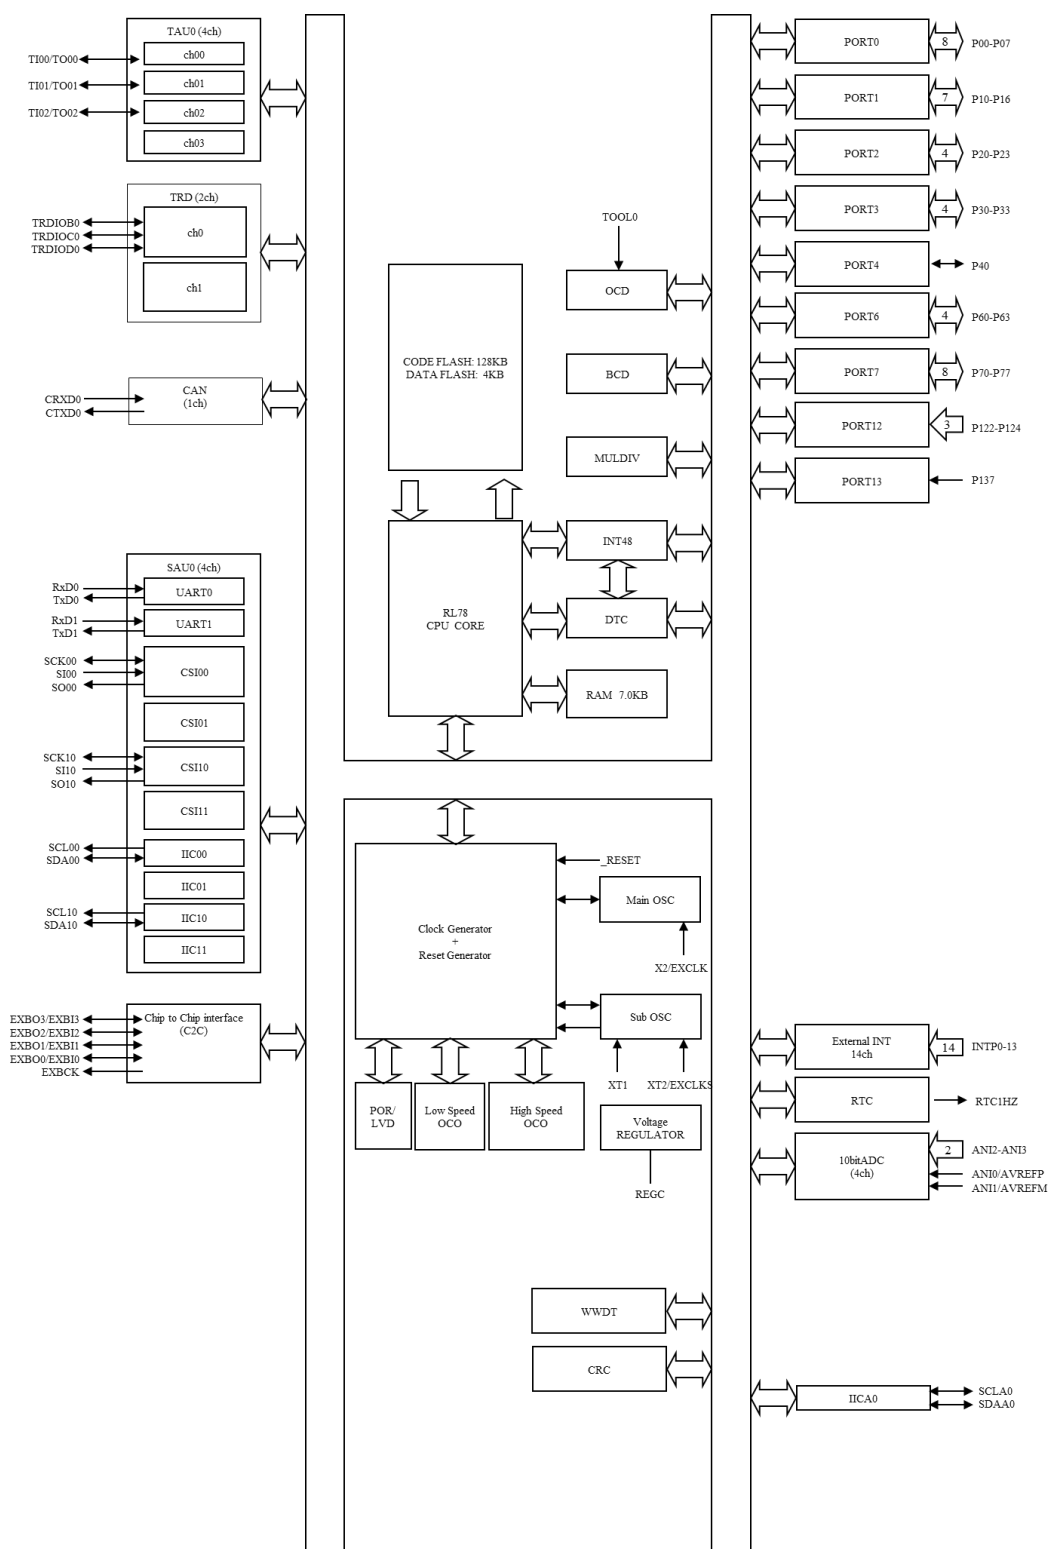

### 5.2 System block diagram

**Note** VIN10 pin and VIN9 pin are only applicable to RAJ240100.

**Caution** The example peripheral circuit does not guarantee proper operation. Please perform sufficient evaluation using the actual application to determine the circuits and peripherals.

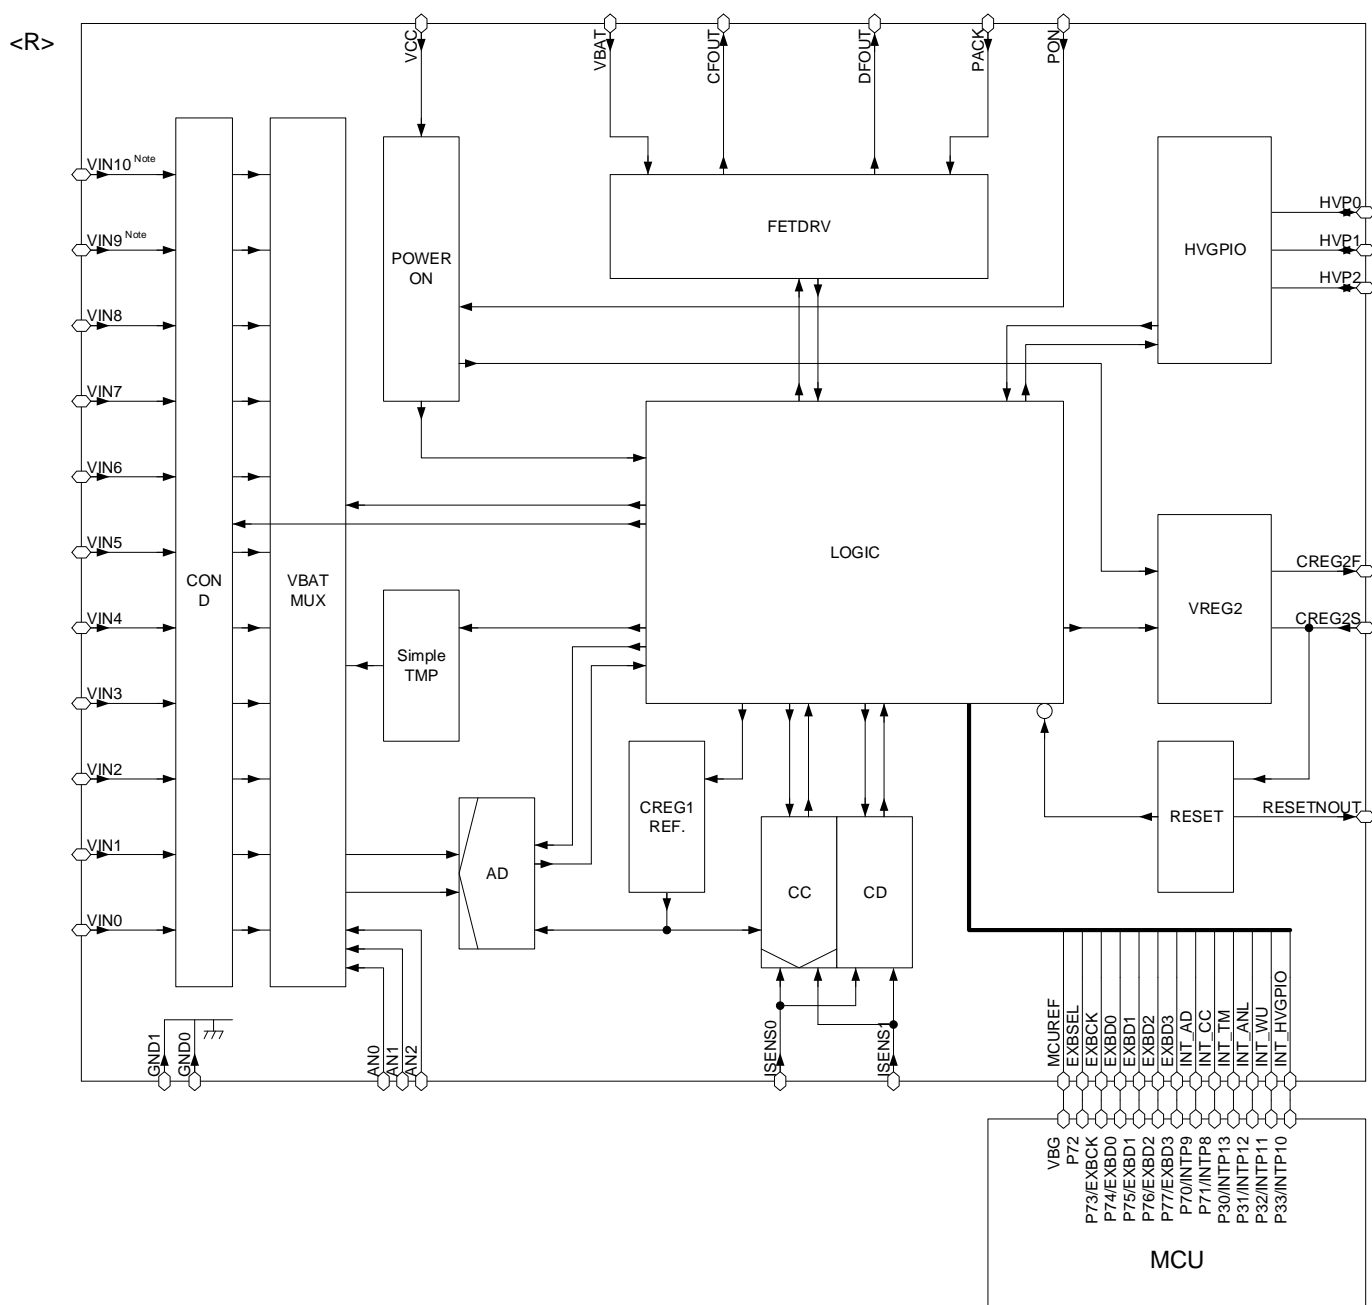

### 5.3 MCU block diagram

**Caution 1.** P30, P31, P32, P33, P70, P72, P73, P74, P75, P76 and P77 are connected to the internal AFE chip and not connected to the package external pins.

**Caution 2.** Each interrupt request of AFE are assigned to P30/INTP13, P31/INTP12, P32/INTP11, P33/INTP10, P70/INTP9 and P71/INTP8.

## 6. Application Guideline

### 6.1 Typical Application Specification

A typical specification example of Li-ion battery management unit as shown below.

From the next page, the typical application guideline is explained for RAJ240100 (10 series cells application).

Battery cell assembly : 8S1P (8 cells in series and 1 cell in parallel) for RAJ240090  
: 10S1P (10 cells in series and 1 cell in parallel) for RAJ240100

Host interface : System Management Bus (SMBus) Specification, version 1.1.  
: UART  
: CAN

Primary protection : charge FET and discharge FET

Secondary protection : Fuse blow by FGIC (RAJ240090 and RAJ240100) or a secondary protection device.

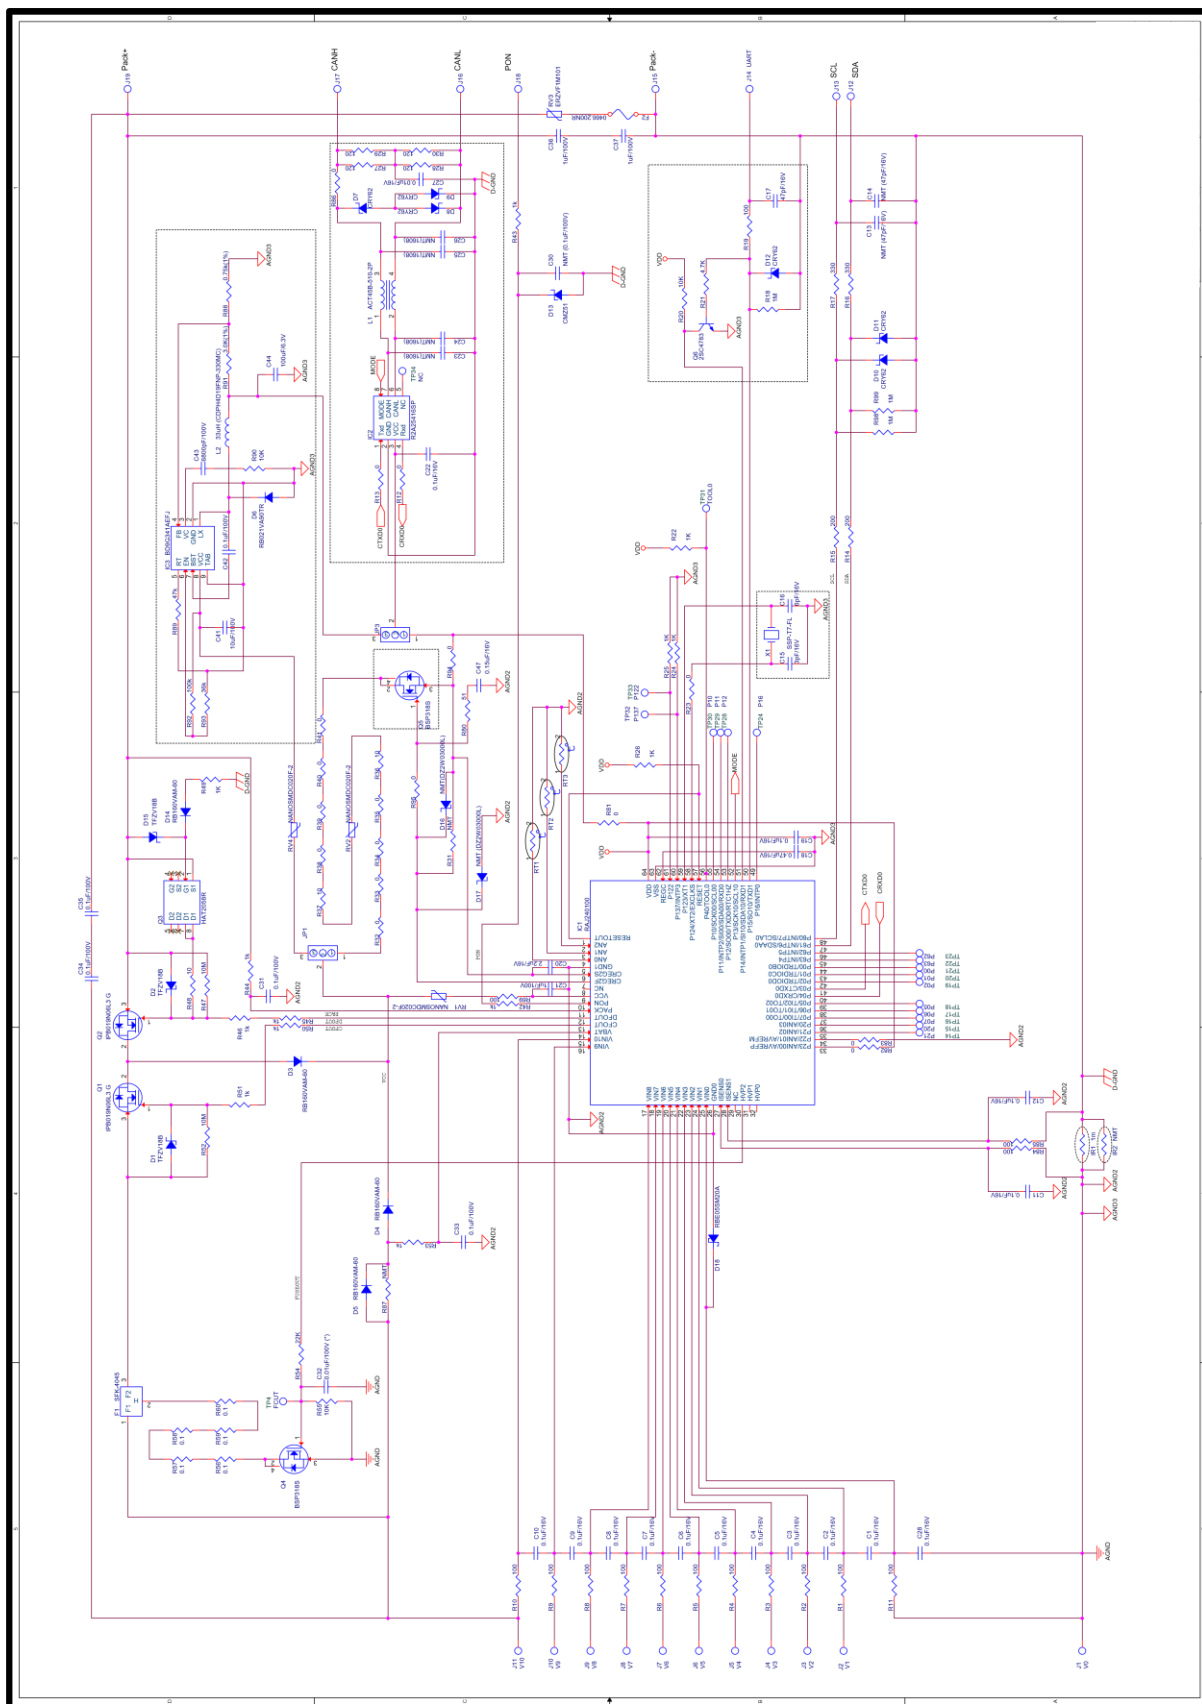

Connector pins:

Pack+	Positive battery pack terminal
SCL	SMBus clock
SDA	SMBus data
CANH	CAN high
CANL	CAN low
UART	UART communication port
PON	High voltage port for battery power on
Pack-	Negative battery pack terminal

External reverse charge protection circuit

Battery and charge/discharge MOSFET temperature measurement with three thermistors

### 6.2 Typical Application Circuit

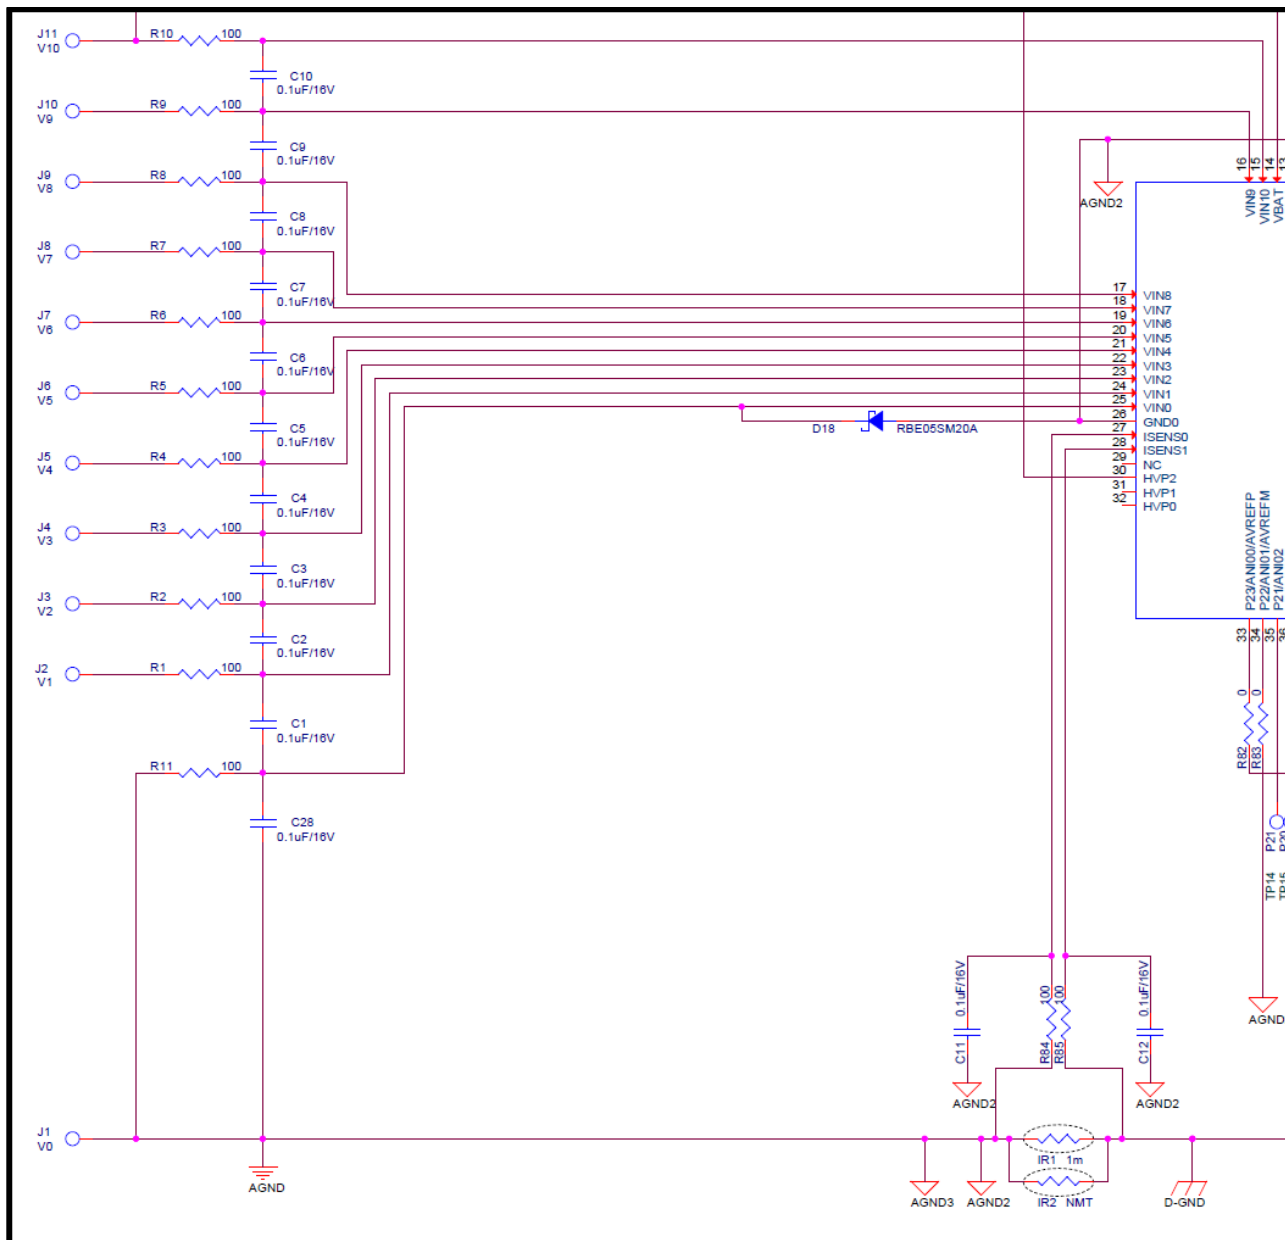

Typical Application Circuit Schematic

### 6.3 Circuit Design Guideline

#### 6.3.1 Cell voltage monitor circuit

- Place an input filter between FGIC's VIN port and each of the cells.
- Place resistors valued around 100Ω and capacitors valued around 0.1uF to VIN1 – VIN10 for surge protection. It is necessary to calculate the cut-off frequency and use correct resistance and capacitance value based on application.

### 6.3.2 Battery power on circuit

- Place resistors value around 2kΩ (1kΩ+1kΩ), capacitor 0.1uF and zener diode to PON for surge protection. It is necessary to calculate cut-off frequency and use correct resistance and capacitance value based on application.

### 6.3.3 PACK port

- PACK port is source voltage of DFOUT (D-FET gate control signal). R44 plays a role in limiting the current limit when charger is reverse-charged. 1kΩ is recommended, if it is too large, the D-FET turn off speed will becomes too slow.
- C31 helps provide stable D-FET boost operation. 0.01μF is recommended. If it is too large, the D-FET turn off speed will becomes too slow.

### 6.3.4 Current monitor

- Potential difference on the sense resistor is monitored by current integration circuit.
- Place a Low Pass Filter (100 Ω, 0.1 μF) at input stage.
- Sense lines should be shielded if small voltage difference is detected to ensure high accurate current sensing.

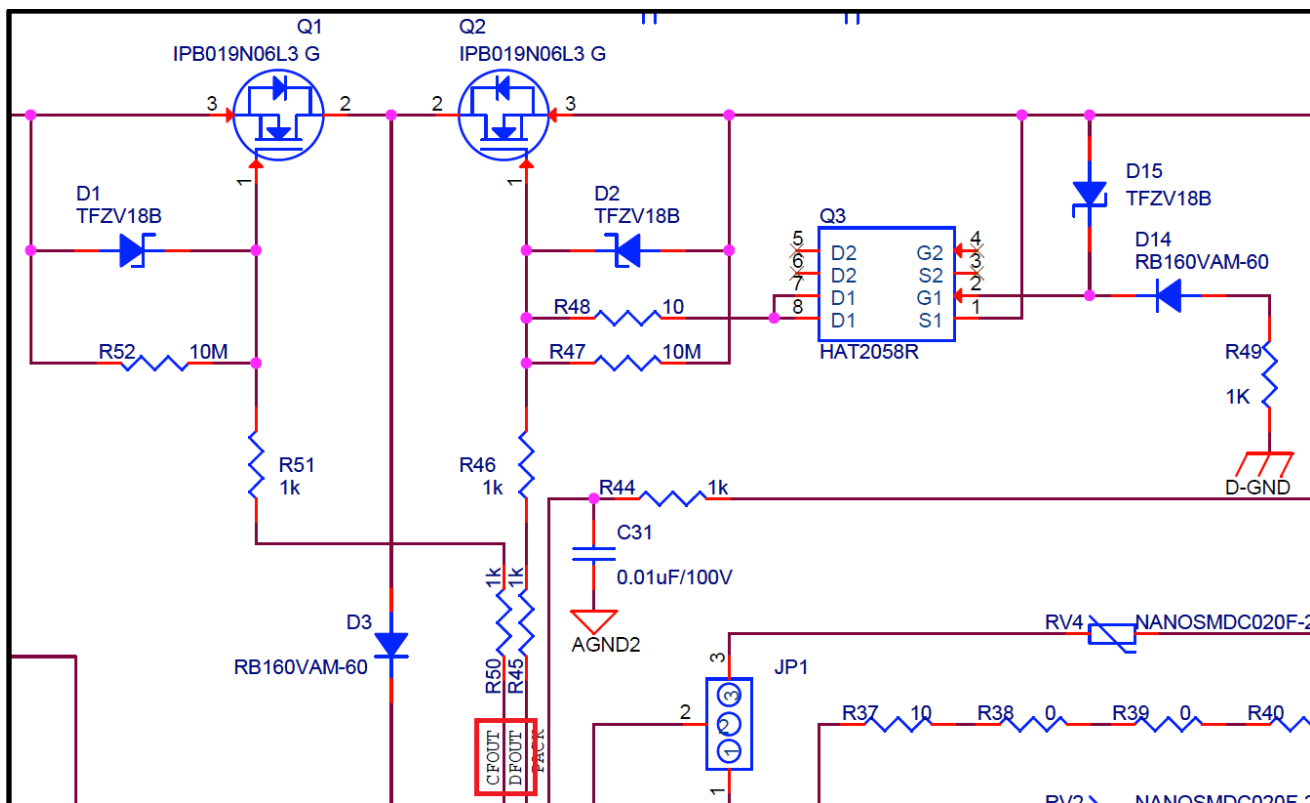

### 6.3.5 Fuse control

- Self-control protector (SCP) is used for fuse in reference circuit.
- The fuse will blow when RAJ240100 drives HVP2 (High voltage GPIO) pin high to make Q4 ON.
- The fuse will blow when overcurrent exceeds the limit of SCP.
- R56-R60 are used for battery electrochemical migration short circuit countermeasures.

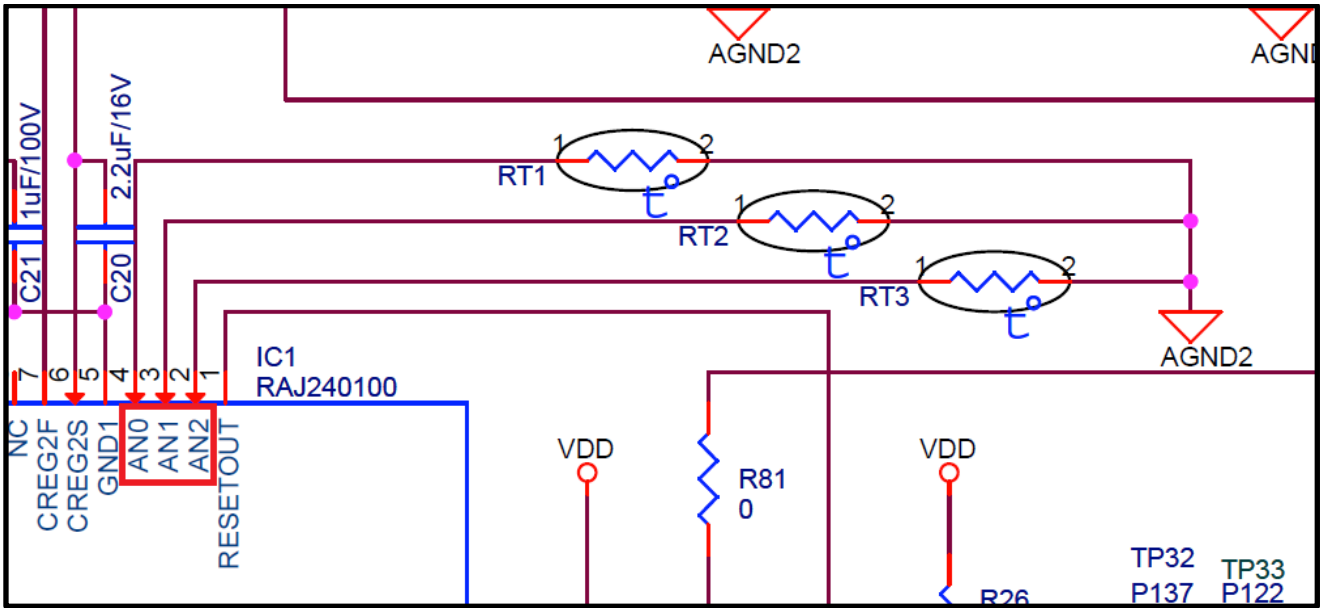

### 6.3.6 C-FET and D-FET control

- Q3 is located between gate and source of Q2 to make D-FET turn off when charger is reverse connected.
- R49 is for Q3 gate protection. (1kΩ is recommended.)
- R45, R46 and R50, R51 are use as gate protection and C-FET/D-FET noise reduction. (2kΩ is recommended.)
- R47 and R52 are used to fix C-FET/D-FET gate voltage in order to keep stable off state when FET is turn off. 10MΩ is recommended to prevent voltage drop.

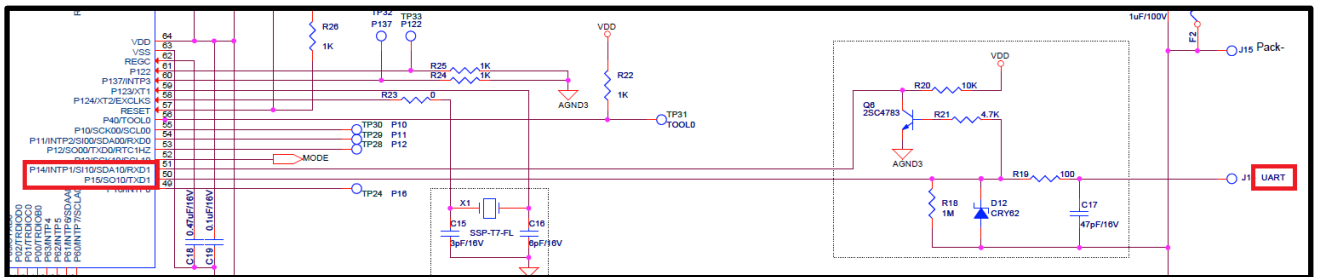

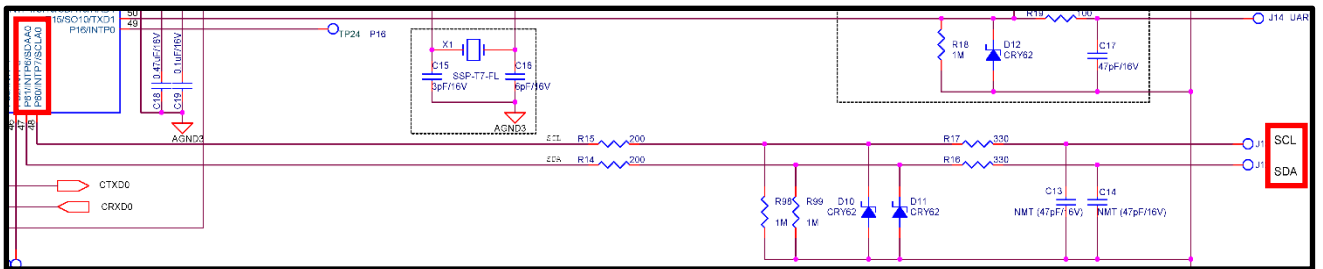

### 6.3.7 Thermistor

- ADC voltage measurement pins (AN0, AN1, AN2) are assigned for thermistor.

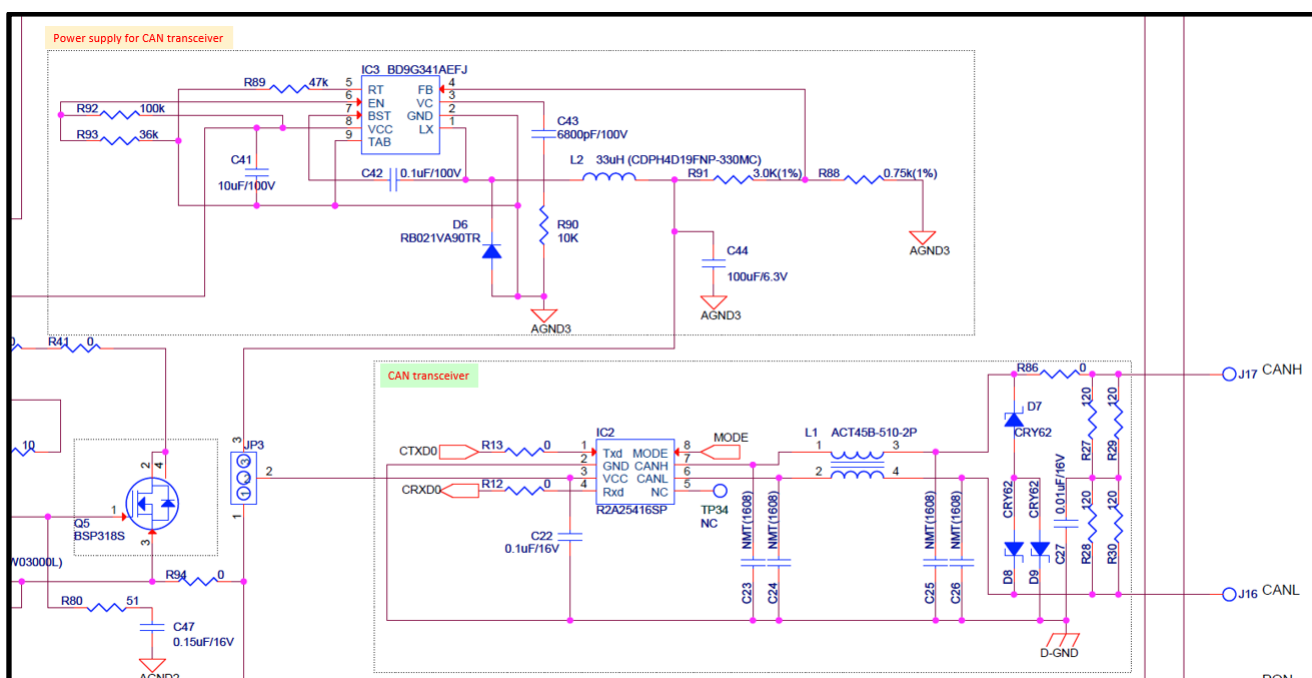

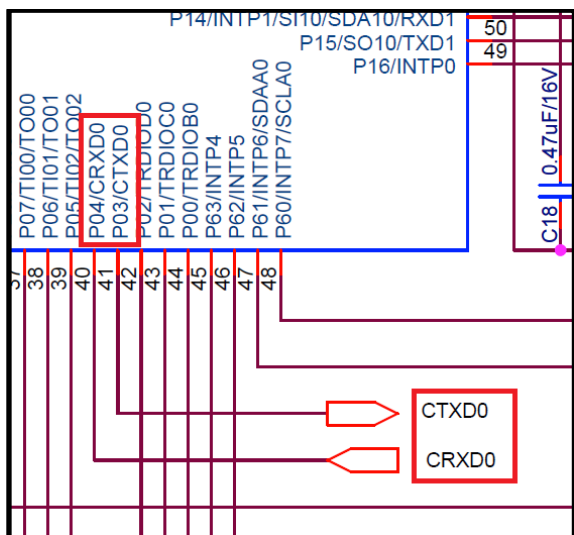

### 6.3.8 Communication line

- RAJ240090 / RAJ240100 support 3 kinds of communication, SMBus, UART and CAN.
- For electrical over stress countermeasure, input 200 Ω , 330 Ω resistance, zener diode and capacitance are recommended in SMBus communication line.
- For UART communication, P14 and P15 pins have VDD output circuit, therefore RXD/TXD line pull up voltage should be the same as VDD.
- CAN communication is made possible by adding CAN transceiver externally. It is necessary to adapt external power supply for CAN transceiver.

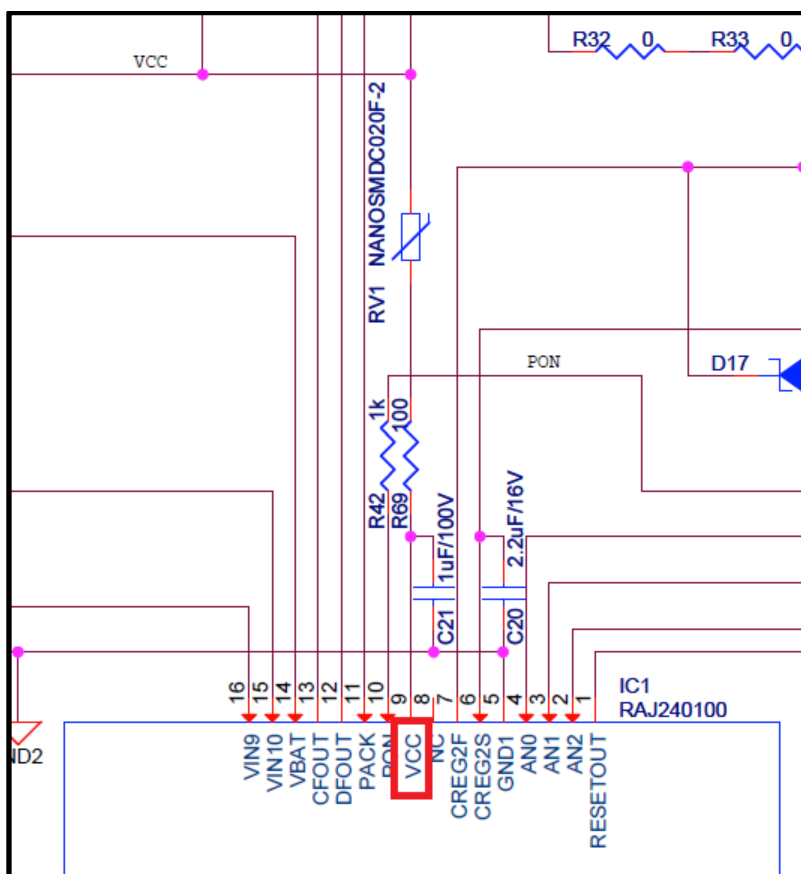

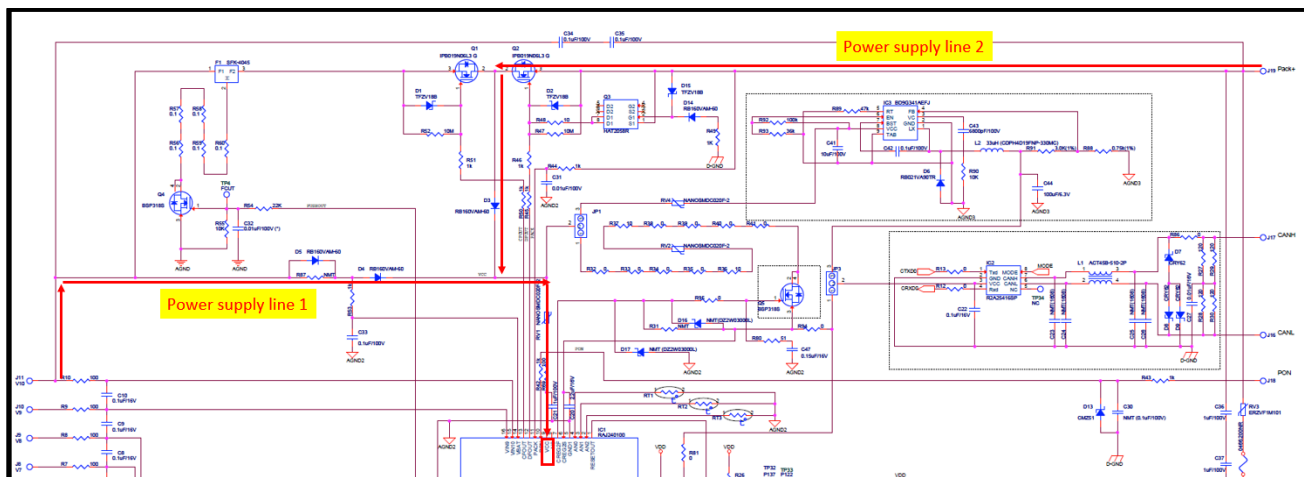

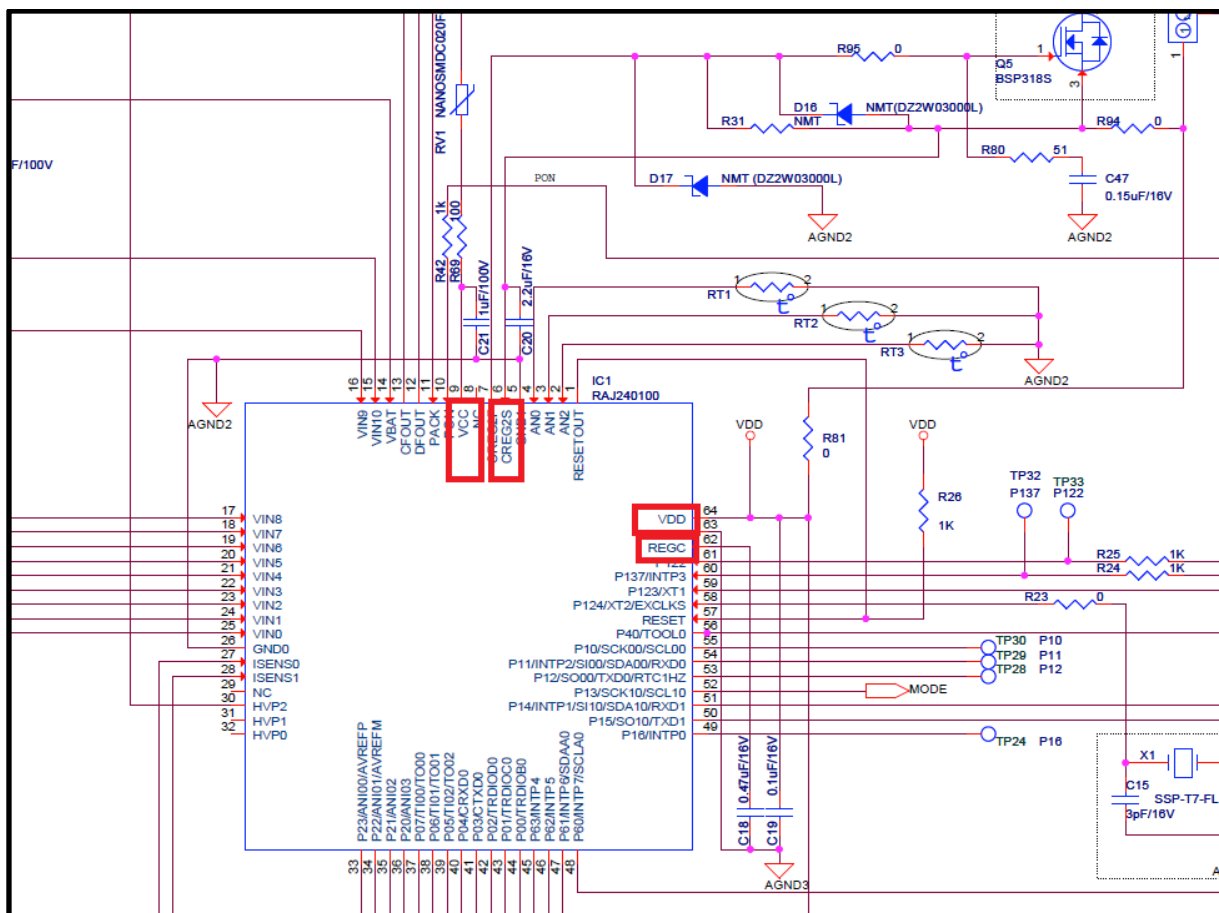

### 6.3.9 Power supply path

- Power is supplied to VCC through the following two paths depending on circumstance.
- Power supplied from battery side when fuse is blown. See power supply line 1.
- Higher output voltage from battery and charger is used as power supply. See power supply line 2.
- For protection of the VCC pin, it is recommended to add resistor and PTC for current limit.

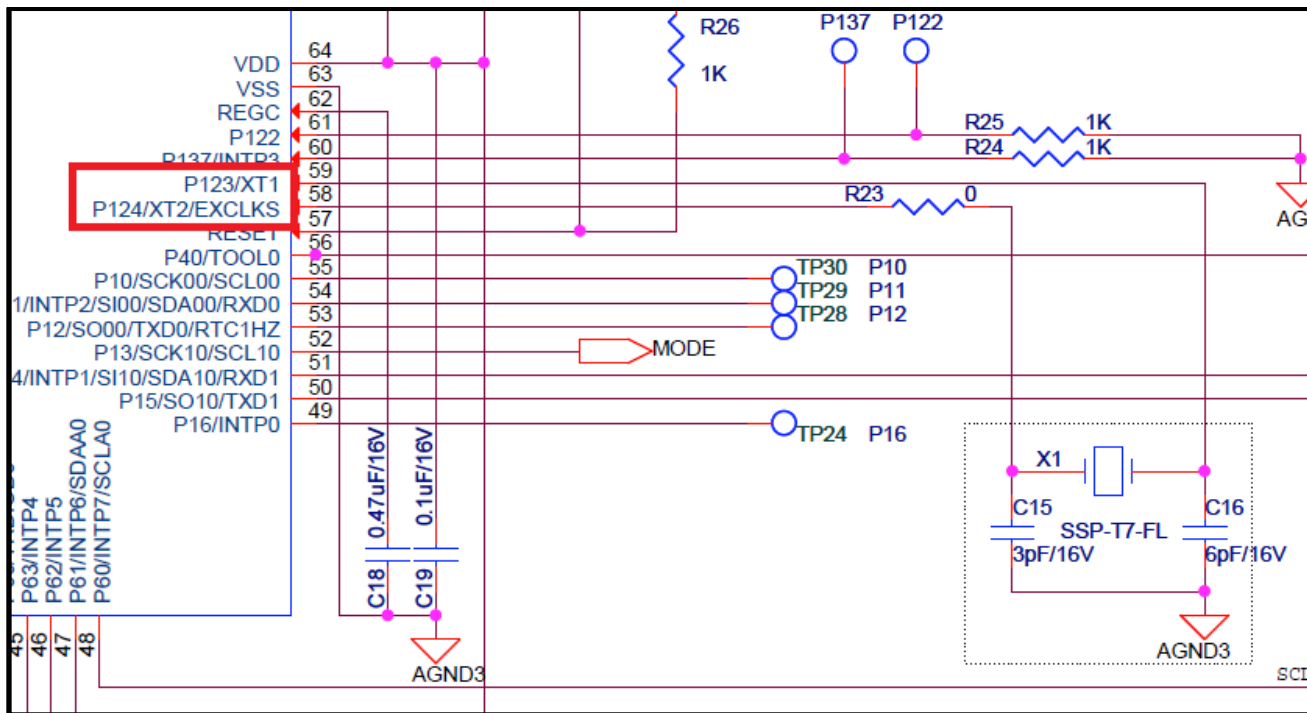

### 6.3.10 VCC, CREG2S, VDD and REGC capacitance

- The following decoupling capacitors must be located adjacent to each terminal.
- C21: VCC (1 $\mu$ F is recommended.)
- C20: CREG2 (2.2 $\mu$ F is recommended.)
- C19: VDD (0.1 $\mu$ F is recommended.)
- C18: REGC (0.47 $\mu$ F is recommended.)

### 6.3.11 Crystal oscillators port XT1 and XT2 for RTC

- RAJ240090 / RAJ240100 support RTC (Real time clock).
- XT1 and XT2 are used for an external crystal oscillator's port. It is recommended to set the XT1 and XT2 line length as short as possible.
- Shield pattern is necessary to XT1 line.

## 6.4 Layout Guidelines

### 6.4.1 Summary

- Large current patterns must be wide and short to minimize voltage drop and heat generation.
- Bypass capacitors must be mounted as close as possible to the device VCC / VBAT and GND pins to prevent erroneous operation due to noise from power supply.
- Capacitors for voltage regulators must be located close to regulator pins to ensure loop stability and ESD tolerance.
- All IC ground must be connected to the negative terminal of battery cells except ground for communication lines.
- Communication lines must be away from small signal current sense line to prevent the input signal from being disturbed by the incoming radiation noise.
- FGIC (RAJ240090 and RAJ240100) must be located away from any heat source (FET, current sense resistor and large current patterns) to minimize the influence of heat.

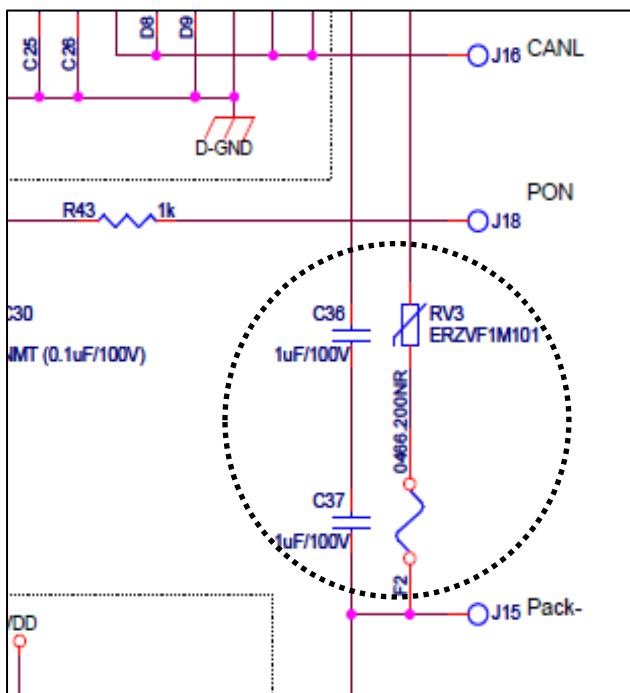

### 6.4.2 ESD protections on each terminal (basic policy)

- ESD on Pack+ terminal must be discharged to the top side of the cell or to Pack- terminal through a capacitor.
- ESD on Pack- terminal must be discharged to the GND side of the cell.
- ESD on communication terminals and other GPIOs must be discharged to the GND side of the cell via Pack- terminal.
- The noise from PACK+ or PACK- must be discharged to the battery cells so that it will not interfere with FGIC functions and measurements.

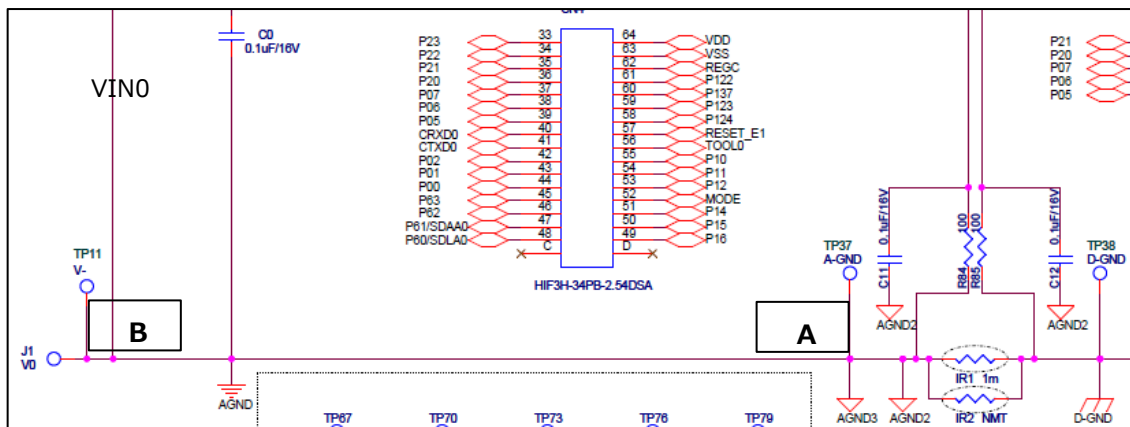

### 6.4.3 Pack+, Pack- (Noise protection element)

- A bypass capacitor must be placed between Pack+ and Pack-. (Countermeasure against ESD)
- A bypass capacitor must be located adjacent to Pack+, Pack-. (Minimize the ESD influence)
- Capacitors must be placed in series. (Countermeasure against short-circuit of capacitors)
- Don't use tantalum capacitor. (Tantalum capacitor can end up with short-circuited failure when damaged.)
- For the terminal protection against noise and overvoltage, It is recommended that it carries varistor or TVS diode .(RV3)
- It is recommended to add Fuse to prevent short circuit.(F2)
- C36, C37, RV3, F2 must be placed as short as possible between PACK + and PACK-. However, be careful not to narrow the distance between Pack + and Pack-.

### 6.4.4 GND connection

- Each analog GND of FGIC should be connected to the point (A) of current detection resistor of the cell side by the pattern with an adequate width. (Prevent potential variation by large current.)
- VIN0 should be connected near point V0 (B).
- The patterns between AGND, AGND2 and AGND3 must not be divided. (Keeping the GND potential of MCU and AFE equal)

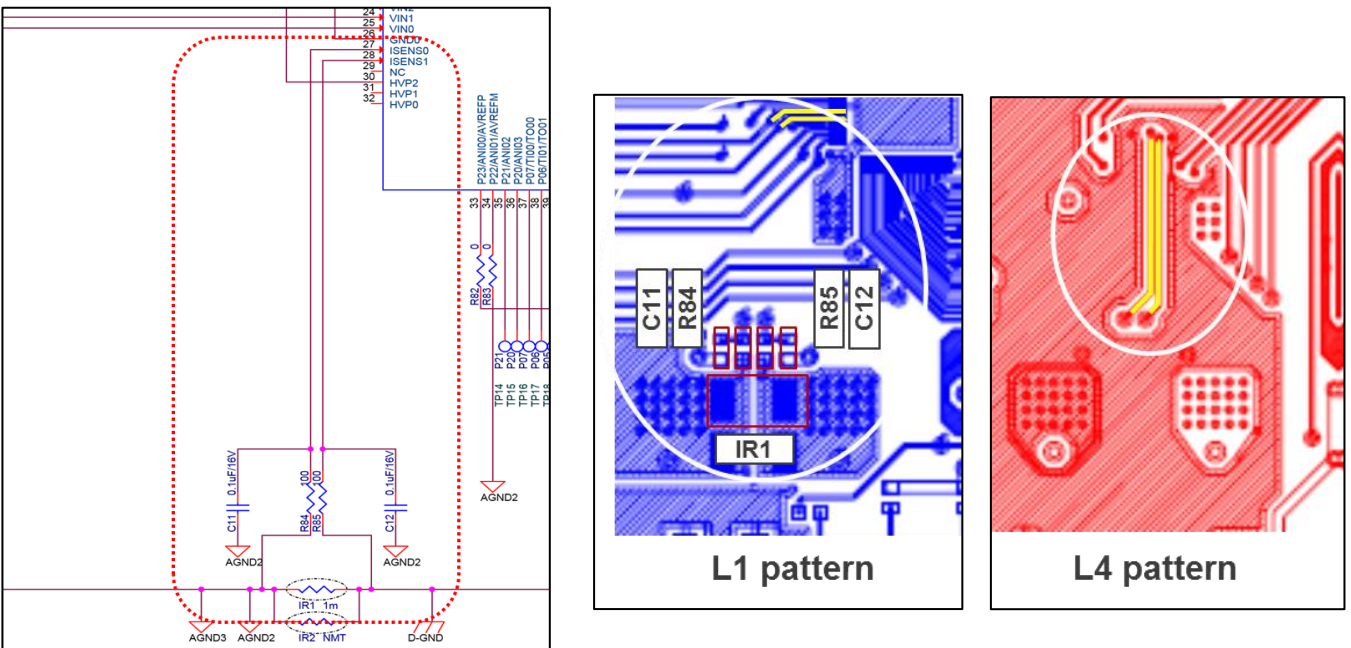

### 6.4.5 Bypass capacitor between VCC and GND0

- The patterns between VCC pin and GND1 pin, a bypass capacitor is connected and the path must be as short as possible and of equal length. (Countermeasure for ESD)  
FGIC and bypass capacitors must be placed on the same side of PCB without any through-hole.
- The lines to bypass capacitor must be wide and short. (To keep bypass capacitor effective in suppressing the potential variation.)

### 6.4.6 Current Monitor (ISENS0, ISENS1)

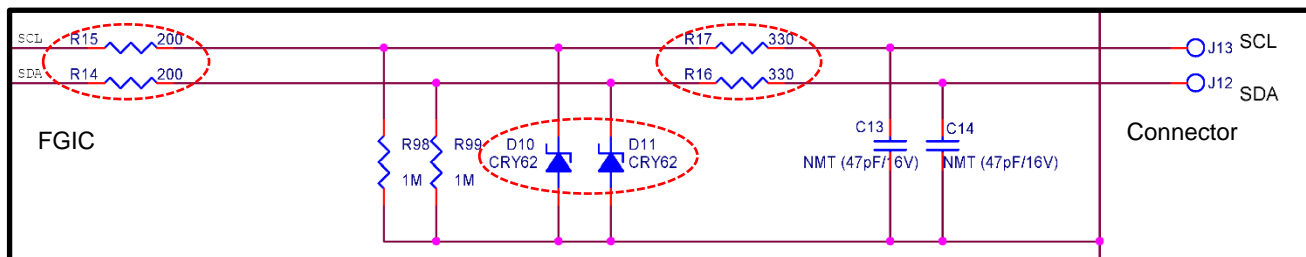

- Two lines from current sense resistor to ISENS0, ISENS1 must be the same in width and length, and in parallel with the same space between the two lines. (Prevent erroneous detections due to noise)
- LPF (100 ohm and 0.1 uF) and a shield pattern should be placed to ISENS0/1 lines. (Countermeasure against noise)

### 6.4.7 Communication line (SMBus)

- SMBus lines must be equipped with zener diodes. And it is necessary to mount resistors on the side of FGIC and pack connector. (Zener diode and the resistor on the side of connector are for surge countermeasures, the resistor on the side of FGIC for noise countermeasure.)
- The resistor on the side of the FGIC must be located as close to the FGIC as possible

### 6.4.8 Unused Pins

- Unused pins are recommended to be connected to GND via resistors as ESD countermeasure. (Setting low output by software prevents the terminal from becoming indefinite).

## General cautions for Handling Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

### 1. Handling of Unused Pins

Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.

- The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

### 2. Processing at Power-on Processing during Power-on

The state of the product is undefined at the moment when power is supplied.

- The states of internal circuits in the LSI are indeterminate undetermined and the states of register settings and pins are undefined at the moment when power is supplied.

In a finished product where the reset signal is applied to the external reset pin, the states state of pins are not guaranteed from the moment when power is supplied until the reset process is completed.

In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

### 3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

- The reserved addresses are provided for possible future expansion of functions only. Do not access these addresses; the correct operation of LSI will not guaranteed if they are accessed.

### 4. Clock Signals

After applying a reset, the reset line will only be released after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

### 5. Differences between Products

Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.

- The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, system-evaluation test needs to be implemented for the given product.

Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics products.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.  
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.  
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.  
Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (space and undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.
6. When using the Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat radiation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions or failure or accident arising out of the use of Renesas Electronics products beyond such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please ensure to implement safety measures to guard them against the possibility of bodily injury, injury or damage caused by fire, and social damage in the event of failure or malfunction of Renesas Electronics products, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures by your own responsibility as warranty for your products/system. Because the evaluation of microcomputer software alone is very difficult and not practical, please evaluate the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please investigate applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive carefully and sufficiently and use Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall not use Renesas Electronics products or technologies for (1) any purpose relating to the development, design, manufacture, use, stockpiling, etc., of weapons of mass destruction, such as nuclear weapons, chemical weapons, or biological weapons, or missiles (including unmanned aerial vehicles (UAVs)) for delivering such weapons, (2) any purpose relating to the development, design, manufacture, or use of conventional weapons, or (3) any other purpose of disturbing international peace and security, and you shall not sell, export, lease, transfer, or release Renesas Electronics products or technologies to any third party whether directly or indirectly with knowledge or reason to know that the third party or any other party will engage in the activities described above. When exporting, selling, transferring, etc., Renesas Electronics products or technologies, you shall comply with any applicable export control laws and regulations promulgated and administered by the governments of the countries asserting jurisdiction over the parties or transactions.
10. Please acknowledge and agree that you shall bear all the losses and damages which are incurred from the misuse or violation of the terms and conditions described in this document, including this notice, and hold Renesas Electronics harmless, if such misuse or violation results from your resale or making Renesas Electronics products available any third party.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
